SECURITY ENGINEER

WHAT IS CYBERSECURITY

AND WHY IS IT IMPORTANT?

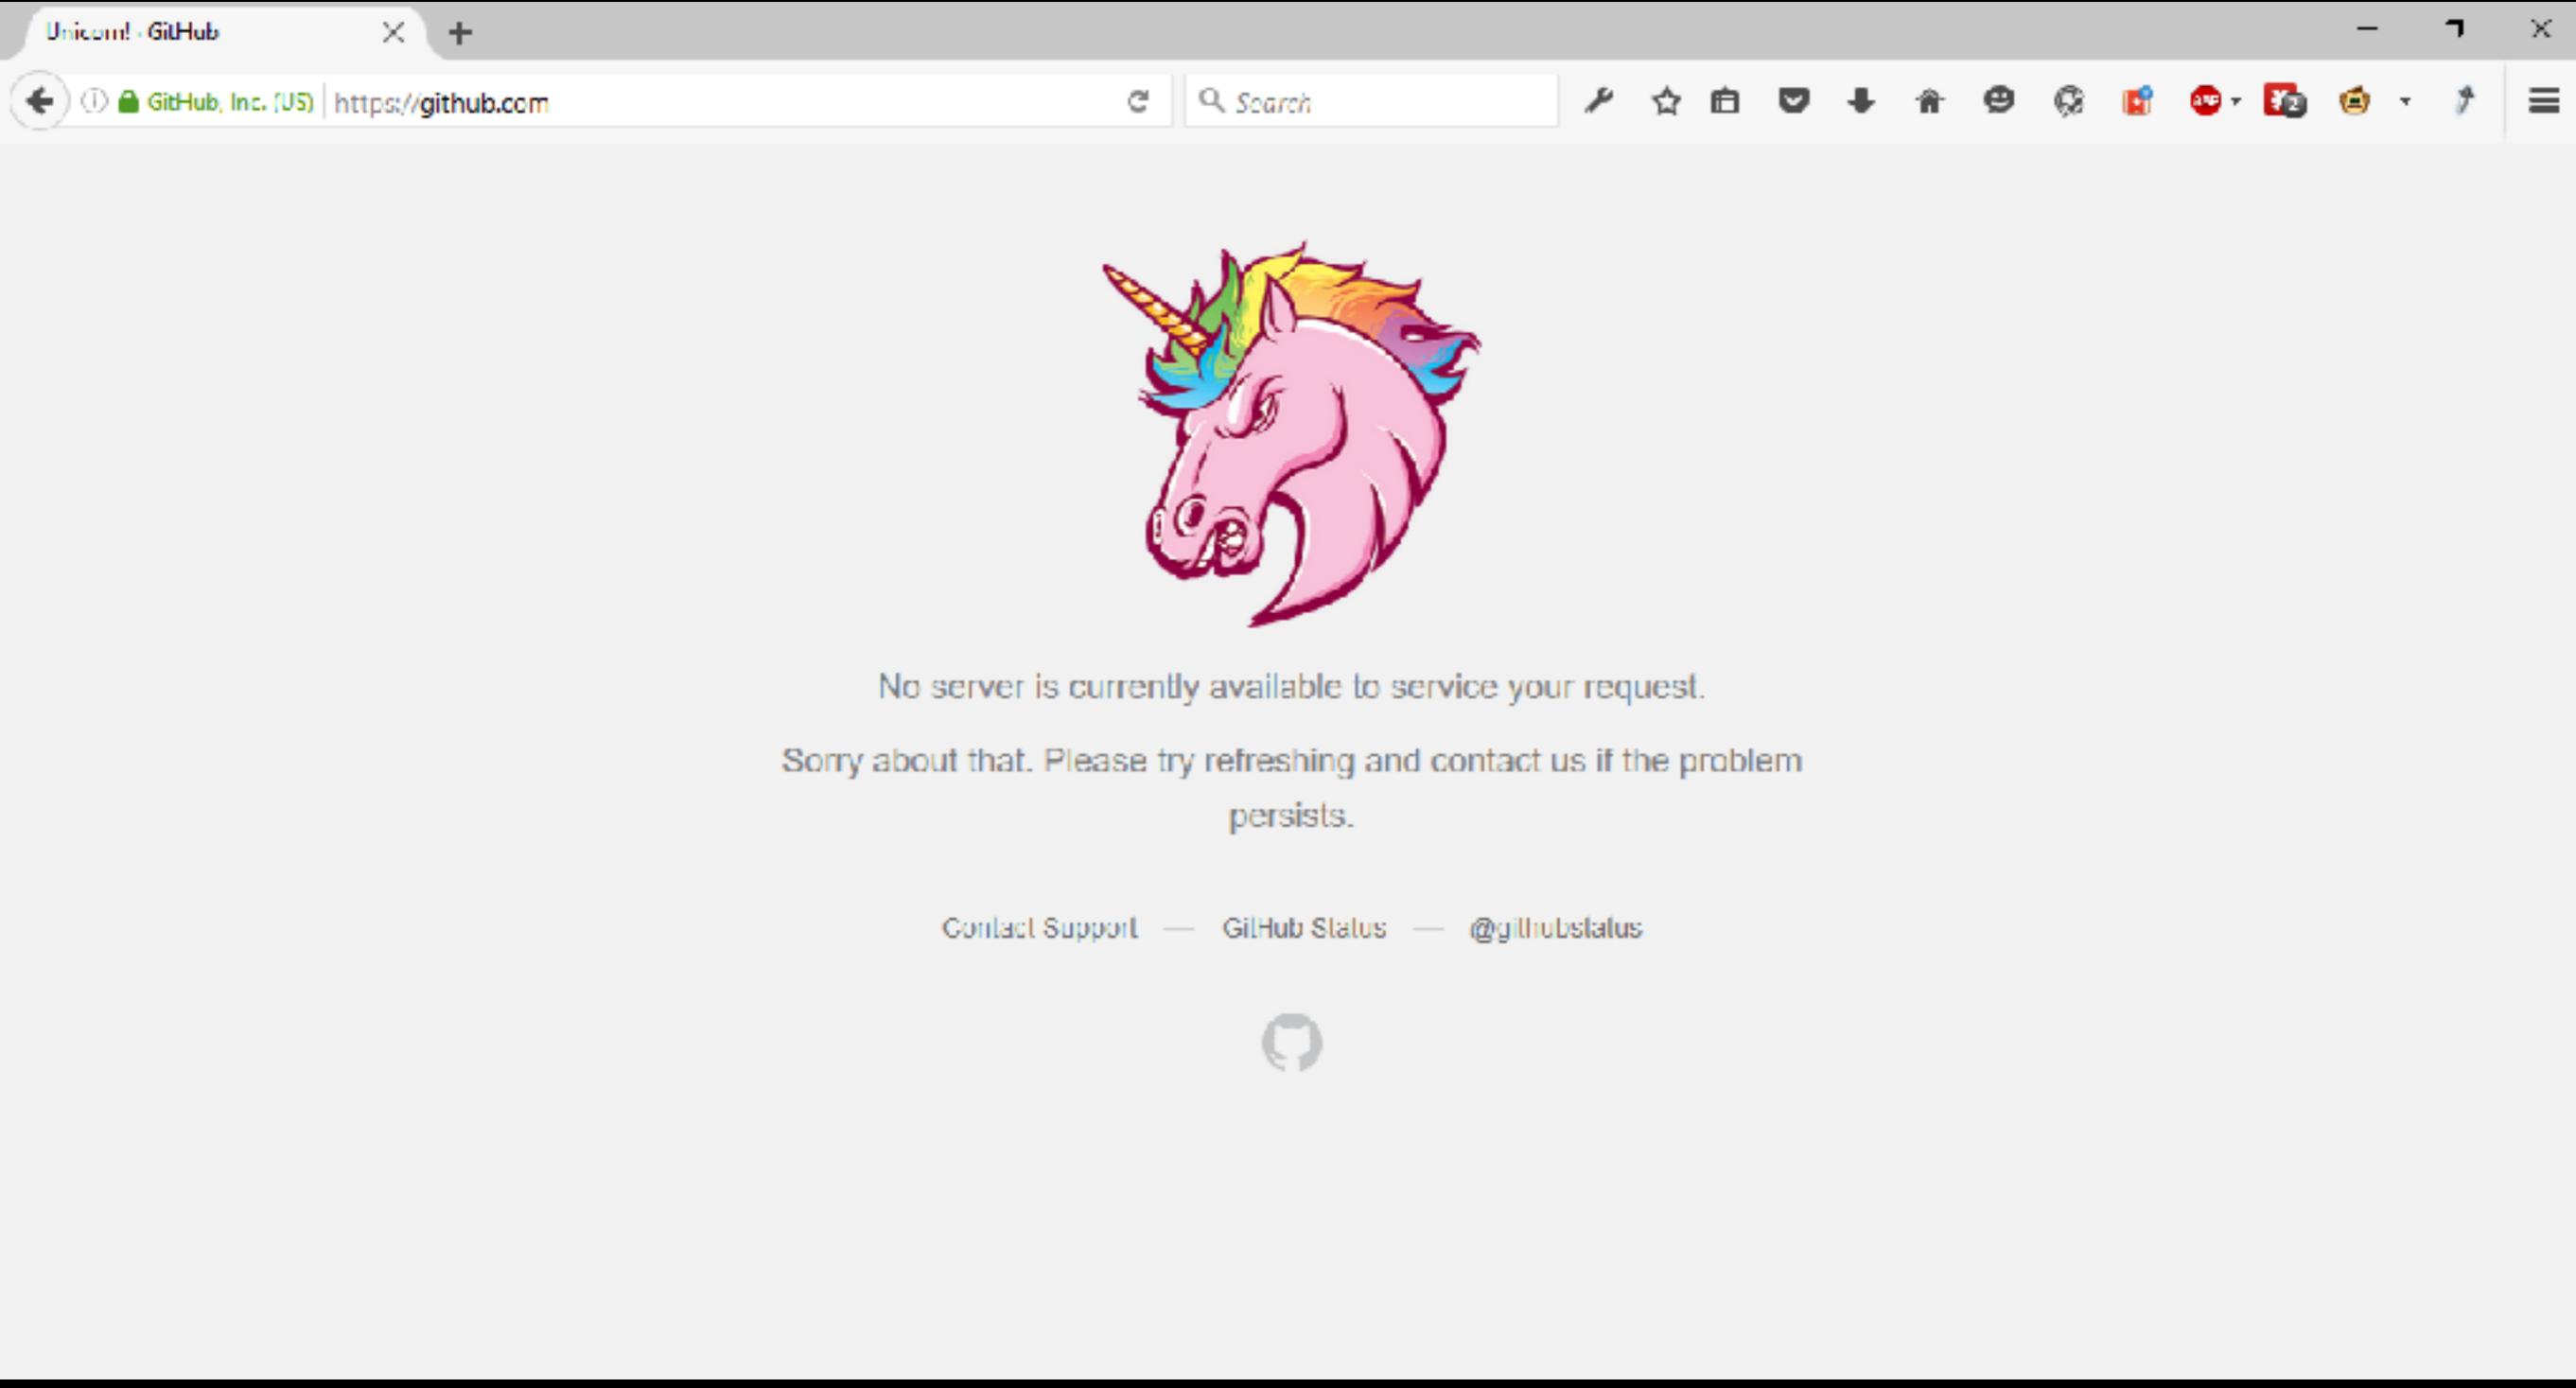

CYBERSECURITY IS THE TECHNIQUES OF
PROTECTING COMPUTERS,
NETWORKS,
PROGRAMS AND
DATA
FROM **UNAUTHORISED ACCESS** OR **ATTACKS**
THAT ARE AIMED FOR **EXPLOITATION**

OCT 2016.

A SERIES OF **DDOS ATTACKS** WERE LAUNCHED AGAINST **DNS SERVERS**, WHICH CAUSED MAJOR WEB SERVICES TO STOP WORKING

The search engine for Power Plants

Shodan is the world's first search engine for Internet-connected devices.

[Create a Free Account](#)[Getting Started](#)

Explore the Internet of Things

Use Shodan to discover which of your devices are connected to the Internet, where they are located and who is using them.

Monitor Network Security

Keep track of all the computers on your network that are directly accessible from the Internet. Shodan lets you understand your digital footprint.

See the Big Picture

Websites are just one part of the Internet. There are power plants, Smart TVs, refrigerators and much more that can be found with Shodan!

Get a Competitive Advantage

Who is using your product? Where are they located? Use Shodan to perform empirical market intelligence.

Shodan is used around the world by researchers, security professionals, large enterprises, CERTs and everybody in between.

Analyze the Internet in Seconds

Shodan has servers located around the world that crawl the Internet 24/7 to provide the latest Internet Intelligence. Who buys Smart TVs? Which countries are building the most wind farms? What companies are affected by Heartbleed? Shodan provides the tools to answer questions at the Internet-scale.

Ooops, your files have been encrypted!

English

▼

not so enough time.

You can decrypt some of your files for free. Try now by clicking <Decrypt>.

But if you want to decrypt all your files, you need to pay.

You only have 3 days to submit the payment. After that the price will be doubled.

Also, if you don't pay in 7 days, you won't be able to recover your files forever.

We will have free events for users who are so poor that they couldn't pay in 6 months.

Payment will be raised on

1/4/1970 00:00:00

Time Left

00:00:00:00

Your files will be lost on

1/8/1970 00:00:00

Time Left

00:00:00:00

[About bitcoin](#)

[How to buy bitcoins?](#)

[Contact Us](#)

How Do I Pay?

Payment is accepted in Bitcoin only. For more information, click <About bitcoin>.

Please check the current price of Bitcoin and buy some bitcoins. For more information, click <How to buy bitcoins>.

And send the correct amount to the address specified in this window.

After your payment, click <Check Payment>. Best time to check: 9:00am - 11:00am GMT from Monday to Friday.

Once the payment is checked, you can start decrypting your files immediately.

Contact

If you need our assistance, send a message by clicking <Contact Us>.

We strongly recommend you to not remove this software, and disable your anti-virus for a while, until you pay and the payment gets processed. If your anti-virus gets updated and removes this software automatically, it will not be able to recover your files even if you pay!

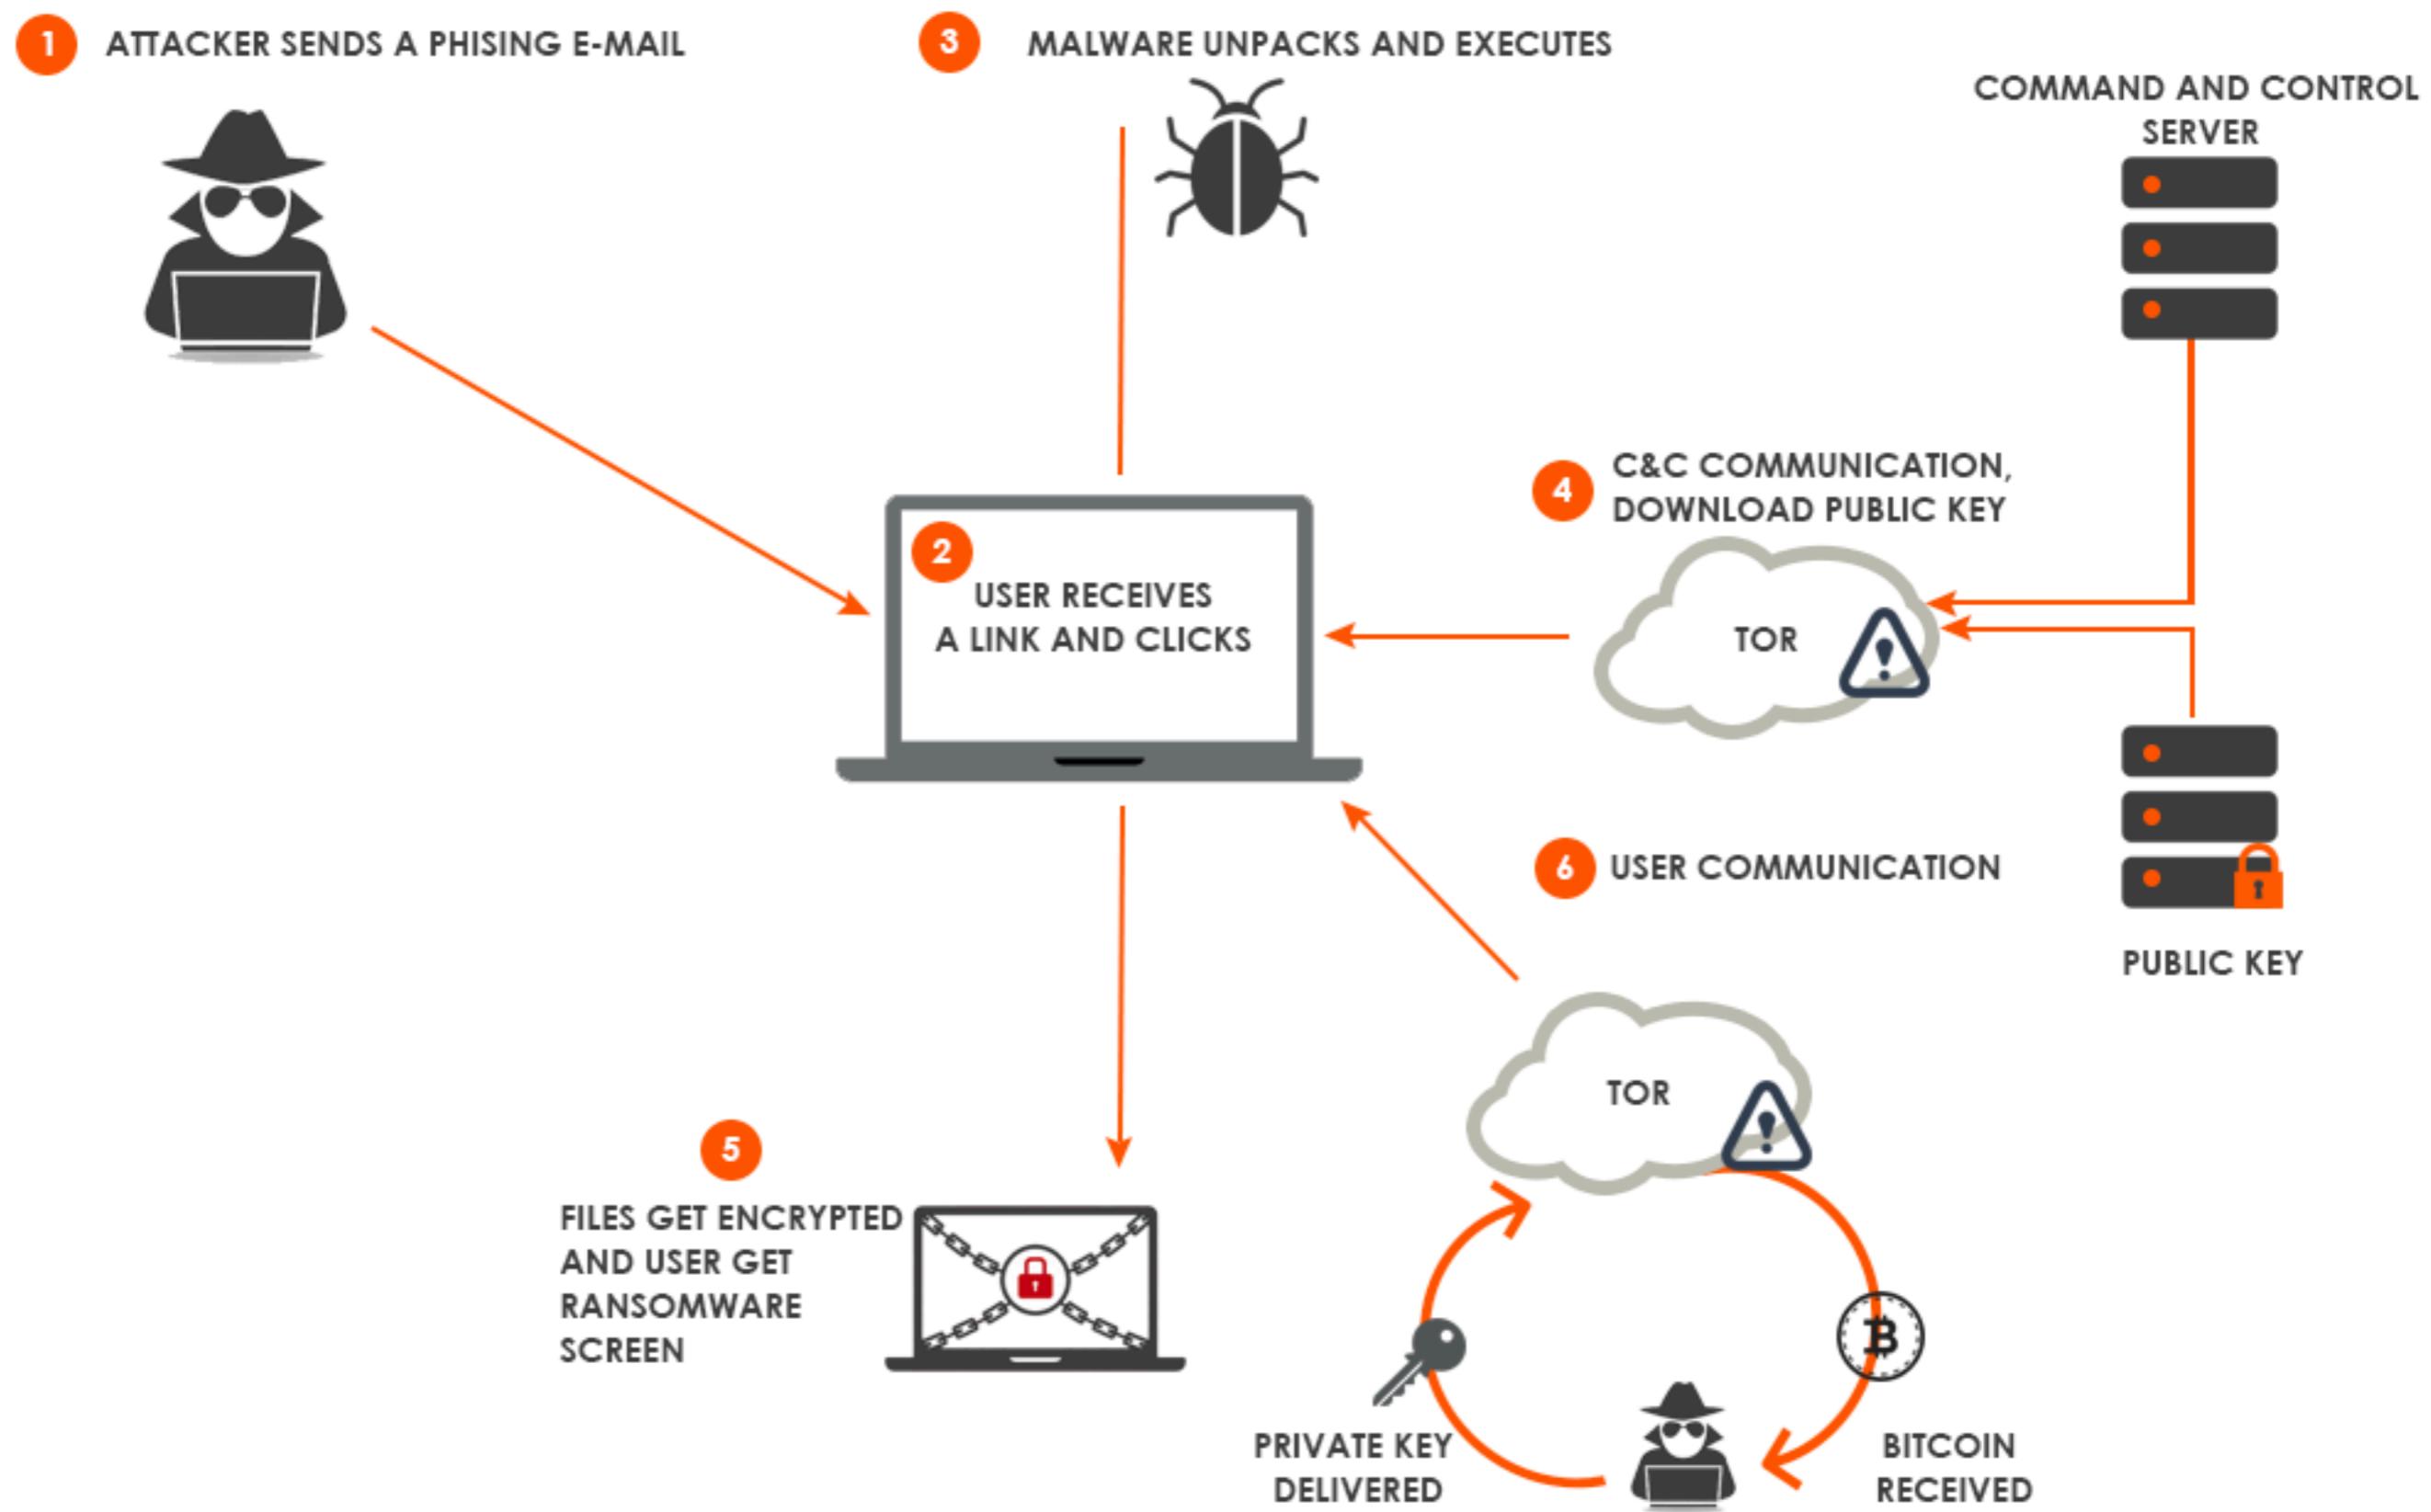

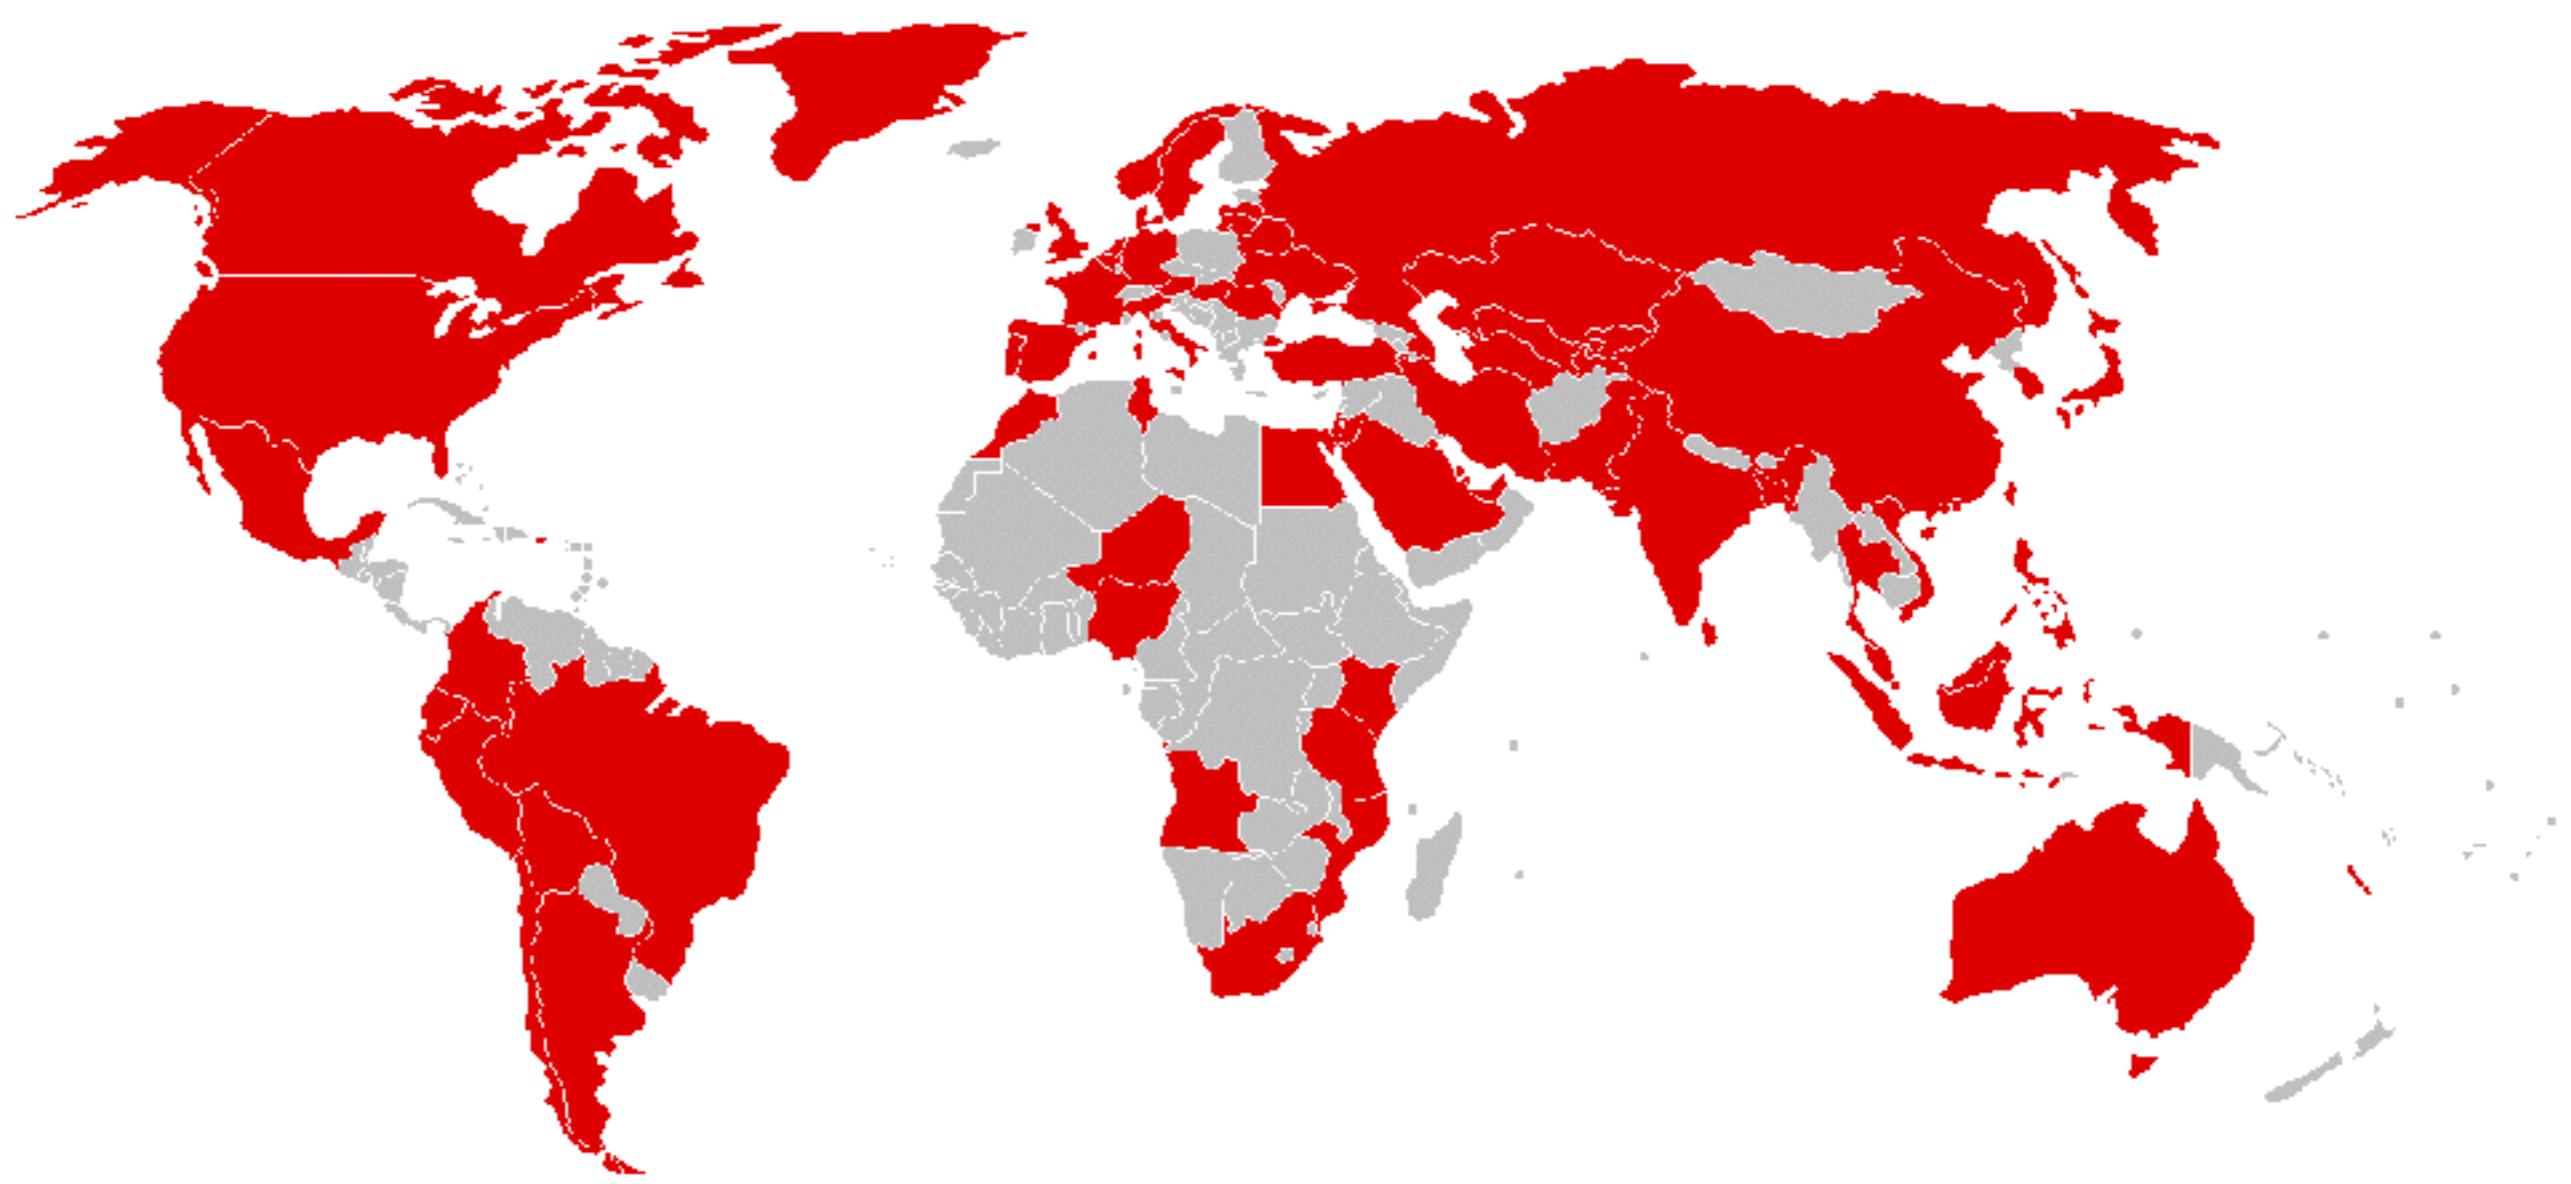

Send \$600 worth of bitcoin to this address:

Dirk Saunders <yxpnmjarrettlwq@outlook.com>

12:07 PM (8 minutes ago)

to me ▾

I know, ██████████, is your pass word. you may not know me and you are most likely thinking why you're getting this e-mail, correct?

Well, I installed a malware on the adult video clips (pornography) and you know what, you visited this web site to have fun (you know what I mean). When you were watching video clips, your browser started operating as a Rdp (Remote desktop) that has a key logger which gave me accessibility to your screen and also cam. Just after that, my software program gathered every one of your contacts from messenger, social networks, as well as email.

What exactly did I do?

I created a double-screen video. First part displays the video you were watching (you've got a good taste lol), and 2nd part displays the recording of your web cam.

Exactly what should you do?

Well, I believe, \$1200 is a fair price for our little secret. You'll make the payment through Bitcoin (if you don't know this, search "how to buy bitcoin" in google).

BTC ADDRESS: 1JC99fcQMVR4iHdmf3GbHLGHMkPpyFjBu7

(It's CASE sensitive, so copy and paste it carefully)

Note:

You have one day to make the payment. (I've a specific pixel in this message, and right now I know that you've read this e mail). If I do not receive the Bitcoins, I will certainly send out your video recording to all of your contacts including friends and family, colleagues, and so forth. nonetheless, if I receive the payment, I'll destroy the video immediately. If you need proof, reply with "yes!" and I definitely will send your video recording to your 14 friends. It is a non-negotiable one time offer, thus don't ruin my time & yours by responding to this e-mail.

A close-up photograph of a woman's face. She has dark hair, red lipstick, and a gold ring on her middle finger. Her hand is held up to her mouth, with her index finger touching her upper lip in a 'shh' gesture.

[Preview All](#)

[REDACTED] I know everything about you. I even know that you ordered some .. lets call them 'male assistance products' online on 12/11/2018 using your account at Bank Of America, N.a., routing# 121000358 account# [REDACTED] for \$75 for mailing to

[REDACTED] CA [REDACTED] I even know about the other 3 other similar orders. Do your friends and family know you have been buying these aids? Do the partners you find on AMadison know you have been using 'chemical help' to have a good time? Very soon they could find it all out. Social media is a great way of spreading an embarrassing message. Of course I will use email also. Your devices have been compromised. I know everything. **The attached pdf says what you need to do to stop this. Because of filters and keyword this pdf has a password to stop a mail server reading it, the password is 2227. I am giving you very little time.** If you do not act very fast, your full AMadison profile and proof of it will be shared with friends, family, and online over social media - and of course your internet orders..... The end of [REDACTED] (415) [REDACTED] One of the addresses I have for you : [REDACTED]

CA [REDACTED] Date of birth (claimed on AM site) : [REDACTED] First signed up for A.Madison : July 28, 2011, from [REDACTED] - an IP address registered in or near [REDACTED] Username on A.Madison [REDACTED] Security answer on A.Madison : [REDACTED]

FOR ALL YOUR FAMILY AND FRIENDS?

Long-term user of Ashley Madison, a site for married cheats to find other married cheats.

(415) [REDACTED]

One of the addresses I have for you : [REDACTED] CA [REDACTED]

Date of birth on Ashley Madison : [REDACTED]

First signed up for Ashley Madison : July 28, 2011, from [REDACTED] - an IP address registered in or near an IP address registered in or near [REDACTED]

Username on Ashley Madison : [REDACTED]

Security answer on Ashley Madison : [REDACTED]

Of all the private messages you sent to members, the reply you sent on Sunday July 31, 2011 was the best. Perv!

Send 0.1188 bit.coin to the bit.coin address 1NesEJSxmwJcmUwfgpv7a55ycVVVXLbsir before January 21 or I will send all of this and much more to everyone who knows you on January 21.

There is only one way to protect yourself - pay now. A search engine will show you how to get and send bit.coin. You can search google or bing for "Buy bit.coin".

bit.coin addresses are case sensitive! aBcd1 is not the same as abcd1

At the top is a QR code if you do not want to type the address and you have a phone or other bit.coin wallet which can read them. The QR code is optional. Only you have this address so I can know when you paid. You can tell from the popular "I have a video of you" emails that they all share the same bit.coin address so there is no video and no way of knowing who paid --They are bluffing and have nothing. I have given you a unique payment address - because I am going to expose those who did not pay so I need to know who did pay. Make no mistake, this is personal to you and you will be exposed. I have more than enough proofs.I never bluff.

Do not pay less than 0.1188 BIT.COIN, YOU WILL BE WASTING YOUR MONEY.

I will not wait, everyone who knows you will hear about how you have been cheating for years. You will not find me, I have protected myself with multiple VPNs and used a cybercate. This email address is a temporary address which will be abandoned tomorrow. The only thing you can do is pay in full ontime. If you miss the deadline, the next day I will send out emails that will totally destroy you. You can stop this by paying.

Unlike some people I always keep my promises. I will expose you and tell them all if you have not paid on time. I have done it before to others and I will do it again.

THE SECURITY HOLE WAS FIXED WITHIN
2.5 HOURS, AND NO ACTUAL DAMAGE
WAS DONE BESIDES **BAD PR** FOR THE TRUMP CAMPAIGN

WEB APP SECURITY

THE CRYPTOMINER INCIDENT

The screenshot shows a web browser window displaying the ICO (Information Commissioner's Office) website at <https://ico.org.uk>. The page features a large 'ico.' logo and a tagline: 'The UK's independent authority set up to uphold information rights in the public interest, promoting openness by public bodies and data privacy for individuals.' Below the header is a navigation menu with links: Home, For the public, For organisations, Report a concern, Action we've taken, and About the ICO.

The browser's developer tools are open, specifically the Elements tab of the DevTools panel. The Elements panel shows the HTML structure of the page, including conditional comments for different versions of Internet Explorer. The CSS panel shows the styles applied to the body element, including a background color of #ffff and a color of #0000. The JavaScript panel shows a script named 'html.js' with a single line of code: 'body#top.ccc-leftccc-triangleccc-lightccc-implccc-consentedccc-hidden'.

The bottom of the browser window displays several warning messages from the Network panel:

- A yellow warning icon states: "The SSL certificate used to load resources from <https://ico.org.uk> will be distrusted in M65. Once distrusted, users will be prevented from loading these resources. [See DEIQS: /e.co/symantecckcerts](#) for more information."
- A blue warning icon states: "A parser-blocking, cross site (i.e. different eTLD+1) script, <https://coinhive.com/lib/coinhive.min.js?rnd=0.5553166442573905>, is invoked via document.write. The network request for this script MAY be blocked by the browser in this or a future page load due to poor network connectivity. If blocked in this page load, it will be confirmed in a subsequent console message. See <https://www.chromestatus.com/feature/5718547946799104> for more details."
- A blue warning icon states: "A parser-blocking, cross site (i.e. different eTLD+1) script, <https://apikeys.civiccomputing.com/c/v7d-ico.org.uk&p-cookiecontrol%20free8v-68k-9FF0d75..>, is invoked via document.write. The network request for this script MAY be blocked by the browser in this or a future page load due to poor network connectivity. If blocked in this page load, it will be confirmed in a subsequent console message. See <https://www.chromestatus.com/feature/5718547946799104> for more details."

The screenshot shows a browser window with the URL <https://www.texthelp.com/en-gb/>. The page content includes the Texthelp logo, navigation links for Store, Pricing, Need help?, We believe, Search, Sectors, and Products, and a user icon. The browser's developer tools are open, specifically the Elements and Styles panels.

Elements Panel: Shows the HTML structure of the page, including the head and body sections. The body section contains a Google Tag Manager noscript block, a form with method="post" action="/en-gb/default.aspx" id="aspnetForm", and a script tag pointing to <https://plus.browsercloud.com/modules/2.5.0/jquery-1.11.2.min.js>.

Styles Panel: Shows the CSS styles applied to the page. It includes rules for element.style, body (background-color: #ffff;), body (margin: 0;), and *, ::after, ::before (styles.min.css:4).

Console Panel: Shows several warning messages related to network requests and SSL certificates. These include:

- A parser-blocking, cross-site (i.e. different eTLD+1) script, <https://coinhive.com/lib/coinhive.min.js?rnd=0.753201234322785>, is invoked via document.write. The `be.js:5` network request for this script MAY be blocked by the browser in this or a future page load due to poor network connectivity. If blocked in this page load, it will be confirmed in a subsequent console message. See <https://www.chromestatus.com/feature/5718547946799184> for more details.
- The SSL certificate used to load resources from <https://cdn.livechatinc.com> will be distrusted in M70. Once distrusted, users will be prevented from loading these `(index):1` resources. See <https://w3c.github.io/webcrypto/certs> for more information.
- The SSL certificate used to load resources from <https://secure.livechatinc.com> will be distrusted in M70. Once distrusted, users will be prevented from loading `(index):1` these resources. See <https://w3c.github.io/webcrypto/certs> for more information.

HOW TO SOCIAL ENGINEER DEVELOPERS

IN 2018 A MALICIOUS PACKAGE, **FLATMAP-STREAM**, WAS
PUBLISHED TO NPM AND WAS LATER ADDED AS
A **DEPENDENCY** TO THE WIDELY USED **EVENT-
STREAM PACKAGE BY RIGHT9CTRL**

8 MILLION DOWNLOADS LATER, APPLICATIONS
ALL OVER THE WEB WERE RUNNING
MALICIOUS CODE IN PRODUCTION

WHAT IS THE EVENT-STREAM PACKAGE?

It's a **toolkit** that provides utilities to create and manage streams

Authored by Dominic Tarr (dominictarr on npmjs)

One of the **432 packages** he owns on npmjs

Received contributions from **33 different contributors**

JULY, 2015. GITHUB USER, DEVIOUS, COMMENTS ON
AN ISSUE ON THE EVENT-STREAM PROJECT
QUESTIONING **WHETHER A FLATMAP
FUNCTIONALITY WOULD BE WELCOMED**

SOCIAL ENGINEERING DEVS

devinus commented on Jul 31, 2015

...

@dominictarr Interesting. Would you accept a `flatMap` patch using this functionality?

devinus commented on Jul 31, 2015

...

I wonder why `mapSync` uses `emit` rather than `queue`.

dominictarr commented on Jul 31, 2015

Owner

...

@**devinus** ah, it's probably just old. I don't use this module anymore, i now use
<https://github.com/dominictarr/pull-stream>

If you publish a `flatMap` module and then make a pr to include it, i'll merge.

AUGUST, 2018. A USER IDENTIFIED AS 'ANTONIO MACIAS' IN NPM CREATED AND **PUBLISHED A NON-MALICIOUS PACKAGE** CALLED FLATMAP-STREAM

NEXT, ANTONIO PROPOSED THAT THE EVENT-STREAM PROJECT USES THE FLATMAP PACKAGE

RIGHT9CTRL APPROACHED DOMINIC ASKING TO ASSIST WITH THE PROJECT AND TO MAKE THE NECESSARY CHANGES

DOMINIC ACCEPTED RIGHT9CTRL'S OFFER AND MAKES THEM A CONTRIBUTOR TO THE EVENT-STREAM GITHUB PROJECT, AS WELL AS **GAVE RIGHT9CTRL FULL NPM PUBLISHING RIGHTS FOR THE MODULE** ON THE NPM ECOSYSTEM

September 4, 2018: an innocent dependency upgrade.

September 4/5, 2018: added map and split examples [0cc](#), [ee8](#), [c08](#), [05b](#)

September 5, 2018: released event-stream version 3.3.5 with [918](#).

September 9, 2018: the flatmap-stream dependency was added under [e31](#)

September 9, 2018: created a new minor event-stream release 3.3.6 in [599](#)

September 16, 2018: flatmap-stream was removed from the event-stream code in [908](#) and from the dependency tree in [2bd](#) and released as a major version, 4.0.0

September 20, 2018: [right9ctrl](#) adds further cosmetic code changes that enhance the project's keywords in [60d](#) to presumably further improve the search results on the official npmjs.com registry website

October 5, 2018: a new minor version flatmap-stream@0.1.1 was released with the injection attack in its minified source code. Installations of event-stream will now also fetch the new infected 0.1.1 version of flatmap as a transient dependency.

OCTOBER, 2018. JAYDENSERIC OPENED AN
ISSUE AGAINST NODEMON REPORTING AN
UNEXPECTED DEPRECATION WARNING

Deprecation warning at start #1442

 Closed

jaydenseric opened this issue on Oct 29 · 10 comments

jaydenseric commented on Oct 29

+ ...

The latest version of Nodemon on the latest version of Node.js causes a deprecation warning to be logged when starting.

This relates to Nodemon and not my start script, because when I run `npm start` directly (not via Nodemon) no deprecation warning is logged.

- `nodemon -v` : 1.18.5
- `node -v` : 11.0.0
- Operating system/terminal environment: macOS
- Command you ran:

```
{  
  "watch": "nodemon",  
  "start": "node --experimental-modules --no-warnings -r dotenv/config server"  
}
```

Backdoored sub-dependency? flatmap-stream-0.1.1 and flatmap-stream-0.1.2 #1451

 Closed

NewEraCracker opened this issue 10 days ago · 0 comments

NewEraCracker commented 10 days ago

+  ...

nodemon requires pstree.remy (^1.1.0 - installed 1.1.0) -> ps-tree (^1.1.0 - installed 1.1.0) -> event-stream (~3.3.0 - installed 3.3.6) -> flatmap-stream (^0.1.0 - npm installs 0.1.2).

This last one is very suspicious.

See: [dominictarr/event-stream#115](#)

Please either force version 0.1.0 of flatmap-stream or update event-stream to latest version (which no longer requires the affected module).

Regards.

 [readme.markdown](#)

EventStream

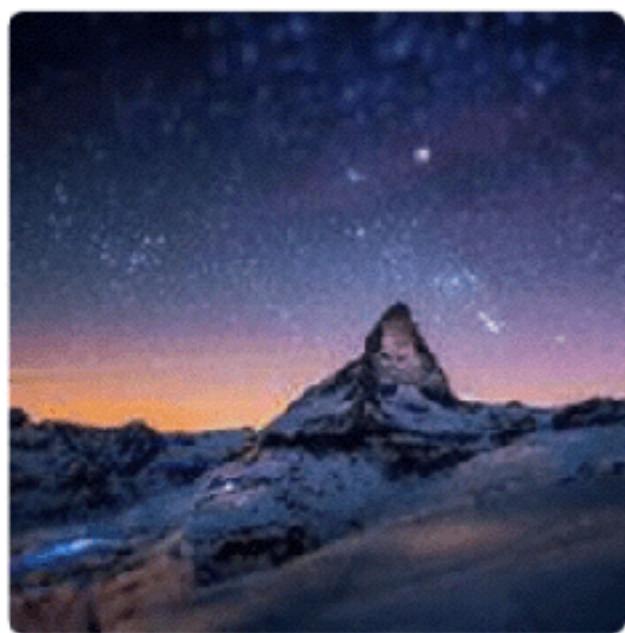

[Streams](#) are node's best and most misunderstood idea, and EventStream is a toolkit to make creating and working with streams easy.

Normally, streams are only used for IO, but in event stream we send all kinds of objects down the pipe. If your application's input and output are streams, shouldn't the throughput be a stream too?

The `EventStream` functions resemble the array functions, because Streams are like Arrays, but laid out in time, rather than in memory.

All the `event-stream` functions return instances of `Stream`.

`event-stream` creates `0.8 streams`, which are compatible with `0.10 streams`.

CUSTOMER REQUESTS INFO ABOUT FEES
FOR DIFFERENT COUNTRIES AND AIRPORTS

Government taxes and fees and carrier charges

Certain taxes, fees and carrier charges may be applied to your booking by British Airways, airport operators, governments or other authorities. Here you will find an explanation of those taxes, fees and carrier charges.

Government, authority and airport charges

These are included in the price of your ticket and are levied by airport operators, governments, or other authorities.

Some airports may levy local taxes, fees or charges against passengers upon arrival or departure. These are not included in the price of your ticket and should be paid locally.

Government and/or airport taxes are refundable, however some countries will apply a Value Added Tax, Sales Tax or equivalent, which will only be refunded on fully flexible tickets.

WHAT IS WEB APPLICATION SECURITY

“Web application security is a **branch of Information Security** that deals specifically with security of websites, web applications and web services.”

-WIKIPEDIA

WHAT IS OWASP?

Open Web Application Security Project

Community dedicated to enabling organisations
to conceive, develop, acquire, operate and
maintain applications that can be trusted

www.owasp.org

Who is the OWASP Foundation?

The Open Web Application Security Project (OWASP) is a nonprofit foundation that works to improve the security of software. Through community-led open source software projects, hundreds of local chapters worldwide, tens of thousands of members, and leading educational and training conferences, the OWASP Foundation is the source for developers and technologists to secure the web.

- Tools and Resources
- Community and Networking
- Education & Training

For nearly two decades corporations, foundations, developers, and volunteers have supported the OWASP Foundation and its work. [Donate](#), [Join](#), or become a [Corporate Member](#) today.

Project Spotlight: Zed Attack Proxy

ZAP is a free, easy to use integrated penetration testing tool which now includes a Heads Up Display. Easily used by security professionals and developers of all skill levels, users can quickly and more easily find security vulnerabilities in their applications. Given the unique and integrated design of the Heads Up Display, developers new to security testing will find ZAP an indispensable tool to build secure software. [Learn more](#) about ZAP.

Featured Chapter: Bay Area

Hosted at some of most iconic technology companies in the world, the Bay Area chapter is one of the Foundation's largest and most active. This month they are hosting a Hacker Day and monthly meetups in San Francisco at Insight Engines and in South Bay at EBay. Usually the agenda includes three provocative and interesting talks, lots of interesting people to meet, and great food. The Bay Area Chapter also participates in planning AppSec California.

OWASP

OWASP Top 10 - 2017

The Ten Most Critical Web Application Security Risks

The primary aim is to **educate** developers, designers, architects, managers, and organisations about the **consequences of the most common and most important web app security weaknesses**

WHAT CHANGED FROM 2013 TO 2017?

OWASP Top 10 - 2013	→	OWASP Top 10 - 2017
A1 – Injection	→	A1:2017-Injection
A2 – Broken Authentication and Session Management	→	A2:2017-Broken Authentication
A3 – Cross-Site Scripting (XSS)	↓	A3:2017-Sensitive Data Exposure
A4 – Insecure Direct Object References [Merged+A7]	U	A4:2017-XML External Entities (XXE) [NEW]
A5 – Security Misconfiguration	↓	A5:2017-Broken Access Control [Merged]
A6 – Sensitive Data Exposure	↗	A6:2017-Security Misconfiguration
A7 – Missing Function Level Access Contr [Merged+A4]	U	A7:2017-Cross-Site Scripting (XSS)
A8 – Cross-Site Request Forgery (CSRF)	X	A8:2017-Insecure Deserialization [NEW, Community]
A9 – Using Components with Known Vulnerabilities	→	A9:2017-Using Components with Known Vulnerabilities
A10 – Unvalidated Redirects and Forwards	X	A10:2017-Insufficient Logging&Monitoring [NEW,Comm.]

IS YOUR APPLICATION VULNERABLE?

- If you don't know **the versions of all components** you use (both client-side and server-side)
- If you don't **scan for vulnerabilities regularly** or subscribe to security bulletins related to the components you use
- If you don't **fix or upgrade** the underlying platform, frameworks, and dependencies in a risk-based, timely fashion

HOW YOU CAN PREVENT IT?

- Remove unused dependencies, unnecessary features, components, files, and documentation
- Continuously inventory the version of both client-side and server-side components and their dependencies using tools
- Only obtain components from official sources over secure links
- Prefer signed packages to reduce the chance of including a modified, malicious component
- Monitor for libraries and components that are unmaintained or do not create security patches for older versions

[Review all vulnerable dependencies](#)

Note: GitHub's security features, such as security alerts, do not claim to catch all vulnerabilities. Though we are always trying to update our vulnerability database and alert you with our most up-to-date information, we will not be able to catch everything or alert you to known vulnerabilities within a guaranteed time frame. These features are not substitutes for human review of each dependency for potential vulnerabilities or any other issues, and we recommend consulting with a security service or conducting a thorough vulnerability review when necessary.

Automated dependency updates

Dependabot creates pull requests to keep your dependencies secure and up-to-date.

[Sign up](#)

[Learn how it works](#)

1,193,192 pull requests merged, and counting!

How it works

1

Dependabot checks for updates

Dependabot pulls down your dependency files and looks for any outdated or insecure requirements.

2

Dependabot opens pull requests

If any of your dependencies are out-of-date, Dependabot opens individual pull requests to update each one.

3

You review and merge

You check that your tests pass, scan the included changelog and release notes, then hit merge with confidence.

Report abuse

Dependabot helps you keep your dependencies up to date. It works with most popular languages.

Every day, Dependabot checks your dependency files for outdated requirements and opens individual pull requests for any it finds. You review the PRs, merge them, and get to work on the latest, most secure releases.

Dependabot is owned and maintained by GitHub. Dependabot Preview is a public beta for functionality that we are integrating directly into GitHub.

[Security] Bump bower from 1.8.2 to 1.8.8 #80

The pull request [Bump bower from 1.8.2 to 1.8.8 #80](https://github.com/dependabot/dependabot-test/pull/80) was merged 7 days ago. It bumps bower from 1.8.2 to 1.8.8. This update includes security fixes. Vulnerabilities fixed: Sourced from The Rock Security Working Group. Arbitrary File Write Through Archive Extraction: attackers can write arbitrary files when a malicious archive is extracted. Affected version: <1.8.7. The pull request includes release notes, commits, and maintainer changes. It also includes a dependency graph and a compatibility score. The pull request has been merged.

Snyk is on a mission to help developers use open source and stay secure. Snyk helps find, fix (and prevent!) known vulnerabilities in your Node.js, Java, Ruby, Python and Scala apps. Snyk is free for open source.

Snyk tracks vulnerabilities in over 800,000 open source packages, and helps protect over 25,000 applications.

83% of Snyk users found vulnerabilities in their applications, and new vulnerabilities are disclosed regularly, putting your application at risk.

[Read more...](#)

The screenshot shows the Snyk dashboard interface. At the top, there's a search bar labeled "search projects" and a button "Add projects". Below the search bar, there are filters for "GitHub", "npm", "Ruby", and "Python". A "language" dropdown is set to "JavaScript" and a "sort" dropdown is set to "New". The main area displays a list of projects:

- candidae/pug**: package.json (5 vulnerabilities), Gemfile.lock (5 vulnerabilities). Last tested: 1 hour ago.
- flat-coated-retriever**: package.json (0 vulnerabilities).
- candidae/pyrenean-shepherd**: package.json (1 vulnerability), Gemfile.lock (0 vulnerabilities). Last tested: 1 day ago.
- candidae/anatolian-shepherd**: Gemfile.lock (2 vulnerabilities). Last tested: 1 week ago.
- candidae/saint-bernard**: (no files listed).

Below the projects, a section titled "Find: Quickly scan all your repos and get a high level overview on the amount of known vulnerabilities" shows five small screenshots of different dashboard sections.

FEATURES - CSP & SRI

CONTENT SECURITY POLICY (CSP) IS AN ADDED LAYER OF SECURITY THAT HELPS TO DETECT AND MITIGATE CERTAIN TYPES OF ATTACKS, INCLUDING **XSS** AND **DATA INJECTION ATTACKS**

THESE ATTACKS ARE USED FOR EVERYTHING FROM DATA THEFT TO SITE DEFACEMENT TO DISTRIBUTION OF MALWARE

Content-Security-Policy:
`default-src https://www.example.com`

Content Security Policy

Content Security Policy (CSP) is an added layer of security that helps to detect and mitigate certain types of attacks, including Cross Site Scripting (XSS) and data injection attacks. These attacks are used for everything from data theft to site defacement to distribution of malware.

References:

- ▶ [HTTP headers](#)

CSP is designed to be fully backward compatible (except CSP version 2 where there are some explicitly-mentioned inconsistencies in backward compatibility; more details [here](#) section 1.1). Browsers that don't support it still work with servers that implement it, and vice-versa: browsers that don't support CSP simply ignore it, functioning as usual, defaulting to the standard same-origin policy for web content. If the site doesn't offer the CSP header, browsers likewise use the standard [same-origin policy](#).

To enable CSP, you need to configure your web server to return the [Content-Security-Policy](#) HTTP header (sometimes you will see mentions of the [X-Content-Security-Policy](#) header, but that's an older version and you don't need to specify it anymore).

Alternatively, the [`<meta>`](#) element can be used to configure a policy, for example: `<meta http-equiv="Content-Security-Policy" content="default-src 'self'; img-src https://*; child-src 'none';">`

Threats

Mitigating cross site scripting

A primary goal of CSP is to mitigate and report XSS attacks. XSS attacks exploit the browser's trust of the content received from the server. Malicious scripts are executed by the victim's browser because the browser trusts the source of the content, even when it's not coming from where it seems to be coming from.

CSP makes it possible for server administrators to reduce or eliminate the vectors by which XSS can occur by specifying the domains that the browser should consider to be valid sources of executable scripts. A CSP compatible browser will then only execute scripts loaded in source files received from those allowlisted domains, ignoring all other script (including inline scripts).

Content Security Policy Reference

The new **Content-Security-Policy** HTTP response header helps you reduce XSS risks on modern browsers by declaring, which dynamic resources are allowed to load.

Try our [CSP Browser Test](#) to test your browser.

Note: It is known that having both **Content-Security-Policy** and **X-Content-Security-Policy** or **X-WebKit-CSP** causes unexpected behaviours on certain versions of browsers. Please avoid using deprecated **X-*** headers.

Directive	Example Value	Description
<code>default-src</code>	<code>'self' cdn.example.com</code>	The <code>default-src</code> is the default policy for loading content such as JavaScript, Images, CSS, Fonts, AJAX requests, Frames, HTML5 Media. See the Source List Reference for possible values.
		<small>CSP Level 1</small>    
<code>script-src</code>	<code>'self' js.example.com</code>	Defines valid sources of JavaScript.
		<small>CSP Level 1</small>    
<code>style-src</code>	<code>'self' css.example.com</code>	Defines valid sources of stylesheets.
		<small>CSP Level 1</small>    
<code>img-src</code>	<code>'self' img.example.com</code>	Defines valid sources of images.
		<small>CSP Level 1</small>    
<code>connect-src</code>	<code>'self'</code>	Applies to <code>XMLHttpRequest</code> (AJAX), <code>WebSocket</code> or <code>EventSource</code> . If not allowed the browser emulates a <code>400</code> HTTP status code.
		<small>CSP Level 1</small>    
<code>font-src</code>	<code>font.example.com</code>	Defines valid sources of fonts.
		<small>CSP Level 1</small>    
<code>object-src</code>	<code>'self'</code>	Defines valid sources of plugins, eg <code><object></code> , <code><embed></code> or <code><applet></code> .
		<small>CSP Level 1</small>    
<code>media-src</code>	<code>media.example.com</code>	Defines valid sources of audio and video, eg HTML5 <code><audio></code> , <code><video></code> elements.
		<small>CSP Level 1</small>    
<code>frame-src</code>	<code>'self'</code>	Defines valid sources for loading frames. <code>child-src</code> is preferred over this deprecated directive.
		<small>Deprecated</small>
<code>sandbox</code>	<code>allow-forms allow-scripts</code>	Enables a sandbox for the requested resource similar to the <code>iframe sandbox</code> attribute. The sandbox applies a same origin policy, prevents popups, plugins and script execution is blocked. You can keep the sandbox value empty to keep all restrictions in place, or add values: <code>allow-forms</code> , <code>allow-same-origin</code> , <code>allow-scripts</code> , <code>allow-popups</code> , <code>allow-modals</code> , <code>allow-orientation-lock</code> , <code>allow-pointer-lock</code> , <code>allow-presentation</code> , <code>allow-popups-to-escape-sandbox</code> , and <code>allow-top-navigation</code>
		<small>CSP Level 1</small>    

Source Value	Example	Description
*	img-src *	Wildcard, allows any URL except data: blob: filesystem: schemes.
'none'	object-src 'none'	Prevents loading resources from any source.
'self'	script-src 'self'	Allows loading resources from the same origin (same scheme, host and port).
data:	img-src 'self' data:	Allows loading resources via the data scheme (eg Base64 encoded images).
domain.example.com	img-src domain.example.com	Allows loading resources from the specified domain name.
*.example.com	img-src *.example.com	Allows loading resources from any subdomain under example.com .
https://cdn.com	img-src https://cdn.com	Allows loading resources only over HTTPS matching the given domain.
https:	img-src https:	Allows loading resources only over HTTPS on any domain.
'unsafe-inline'	script-src 'unsafe-inline'	Allows use of inline source elements such as style attribute, onclick, or script tag bodies (depends on the context of the source it is applied to) and javascript: URIs
'unsafe-eval'	script-src 'unsafe-eval'	Allows unsafe dynamic code evaluation such as JavaScript eval()
'nonce-'	script-src 'nonce-2726c7f26c'	Allows script or style tag to execute if the nonce attribute value matches the header value. For example: <script nonce="2726c7f26c">alert("hello");</script>
'sha256-'	script-src 'sha256-qzn...ng='	Allow a specific script or style to execute if it matches the hash. Doesn't work for javascript: URIs. For example: sha256-qznLcsR0x4GACP2dm0UCKCzCG+Hiz1guq5ZZDob/Tng= will allow alert('Hello, world.');

Content-Security-Policy Examples

Here a few common scenarios for content security policies:

Allow everything but only from the same origin

```
default-src 'self';
```

Only Allow Scripts from the same origin

```
script-src 'self';
```

Allow Google Analytics, Google AJAX CDN and Same Origin

```
script-src 'self' www.google-analytics.com ajax.googleapis.com;
```

Starter Policy

This policy allows images, scripts, AJAX, and CSS from the same origin, and does not allow any other resources to load (eg object, frame, media, etc). It is a good starting point for many sites.

```
default-src 'none'; script-src 'self'; connect-src 'self'; img-src 'self'; style-src 'self';
```

Subresource Integrity (SRI) is a security feature that enables browsers to verify that resources they fetch (for example, from a [CDN](#)) are delivered without unexpected manipulation. It works by allowing you to provide a cryptographic hash that a fetched resource must match.

Note: For subresource-integrity verification of a resource served from an origin other than the document in which it's embedded, browsers additionally check the resource using [Cross-Origin Resource Sharing \(CORS\)](#), to ensure the origin serving the resource allows it to be shared with the requesting origin.

How Subresource Integrity helps [🔗](#)

Using [Content Delivery Networks \(CDNs\)](#) to host files such as scripts and stylesheets that are shared among multiple sites can improve site performance and conserve bandwidth. However, using CDNs also comes with a risk, in that if an attacker gains control of a CDN, the attacker can inject arbitrary malicious content into files on the CDN (or replace the files completely) and thus can also potentially attack all sites that fetch files from that CDN.

Subresource Integrity enables you to mitigate some risks of attacks such as this, by ensuring that the files your web application or web document fetches (from a CDN or anywhere) have been delivered without a third-party having injected any additional content into those files — and without any other changes of any kind at all having been made to those files.

Using Subresource Integrity [🔗](#)

You use the Subresource Integrity feature by specifying a base64-encoded cryptographic hash of a resource (file) you're telling the browser to fetch, in the value of the `integrity` attribute of any `<script>` or `<link>` element.

sri warns about requesting scripts or stylesheets without using subresource integrity.

Why is this important?

A common practice in modern web development is to use third party resources from CDNs or different services (analytics, ads, etc.). However, doing so can increase the attack surface of your web site/app.

While there are techniques to verify the agent is talking with the right server (TLS, HSTS, etc.), an attacker (or administrator) with access to the server can manipulate the content with impunity.

If you want to load a crypto miner on 1,000+ websites you don't attack 1,000+ websites, you attack the 1 website that they all load content from. ([Scott Helme](#))

Subresource integrity is a standard that mitigates this by ensuring that an exact representation of a resource, and only that representation, loads and executes.

What does the hint check?

This hint checks that a website correctly uses SRI, more specifically:

- All the downloaded resources by an `<script>` or `<link rel="stylesheet">` have an `integrity` attribute.
- The `integrity` attribute needs to be valid. I.e.: it should contain something in the form of `sha(256|384|512)-HASH`, where `HASH` is the hashed value of the downloaded body's response using the previously specified algorithm (`sha256`, `sha384`, or `sha512`).
- The minimum cryptographic hash function used is `sha384`. If multiple ones are provided, the highest one will be used to determine if the baseline is met.
- When using a cross-origin resource (e.g.: using a script hosted in a third party CDN), the `<script>` or `<link>` tag needs to have a valid `crossorigin` attribute.
- The resource is served on a `secure context` (i.e.: HTTPS) to guarantee the HTML and resource haven't been tampered during the delivery.
- The hash from the `integrity` attribute needs to be the same as the one calculated using the response's body.
- If multiple hashes are provided, at least one needs to be valid.

Examples that trigger the hint

Cross-origin resource with no `crossorigin` attribute:

[Overview](#)[Scoring Guides](#)[Lighthouse v3 Migration Guide](#)[Audit References](#)[Performance](#)[Progressive Web App](#)[Accessibility](#)[Best Practices](#)[SEO](#)

Lighthouse

Lighthouse is an [open-source](#), automated tool for improving the quality of web pages. You can run it against any web page, public or requiring authentication. It has audits for performance, accessibility, progressive web apps, and more.

You can run Lighthouse in Chrome DevTools, from the command line, or as a Node module. You give Lighthouse a URL to audit, it runs a series of audits against the page, and then it generates a report on how well the page did. From there, use the failing audits as indicators on how to improve the page. Each audit has a reference doc explaining why the audit is important, as well as how to fix it.

[RUN LIGHTHOUSE IN CHROME DEVTOOLS](#)[FILE AN ISSUE](#)

A Post-Mortem of the Malicious event-stream backdoor

By  December 6, 2018 | IN DECODED, OPEN SOURCE VULNERABILITIES
BY TROY HUNT

Last week the unimaginable happened. A malicious package, `larmap-stream`, was published to npm and was being added as a dependency to the `elasticsearch` and `elasticsearch-hotel` packages ([here](#) and [here](#)). Some time, and I’m still not sure exactly how long ago, application code containing this malicious code was pushed to production. We wrote some [early thoughts](#) on our blog ([here](#)) moments after the hidden nature of the bug was first noticed, but are now able to perform a deeper post-mortem looking at a series of the events as they unfolded. I have got to say open source has been instrumental in investigating this issue, and in particular GitHub user [nanci12](#), who never imagined the malicious code.

Weekly Update 129

December 10, 2018

Troy Hunt

Hi, I'm Troy Hunt, I write this blog, create courses for Pluralsight and am a Microsoft Regional Director and MVP. I also speak lots of tech speaking at events and teaching technology professionals.

Upcoming Events

- January 10 - 12, 2019 - DEF CON 27 - Las Vegas, NV
- January 11 - 12, 2019 - Black Hat USA - Las Vegas, NV
- January 15 - 18, 2019 - RSA Conference - San Francisco, CA
- February 11 - 12, 2019 - Microsoft Ignite - Orlando, FL
- February 19 - 21, 2019 - Microsoft Ignite - Atlanta, GA
- March 1 - 2, 2019 - Microsoft Ignite - Seattle, WA
- March 11 - 12, 2019 - Microsoft Ignite - Las Vegas, NV
- March 18 - 20, 2019 - Microsoft Ignite - Sydney, Australia
- March 25 - 26, 2019 - Microsoft Ignite - Melbourne, Australia
- April 1 - 2, 2019 - Microsoft Ignite - Gold Coast, Australia
- April 15 - 16, 2019 - Microsoft Ignite - London, UK
