SECURITY ENGINEER

# WHAT IS CYBERSECURITY

AND WHY IS IT IMPORTANT?

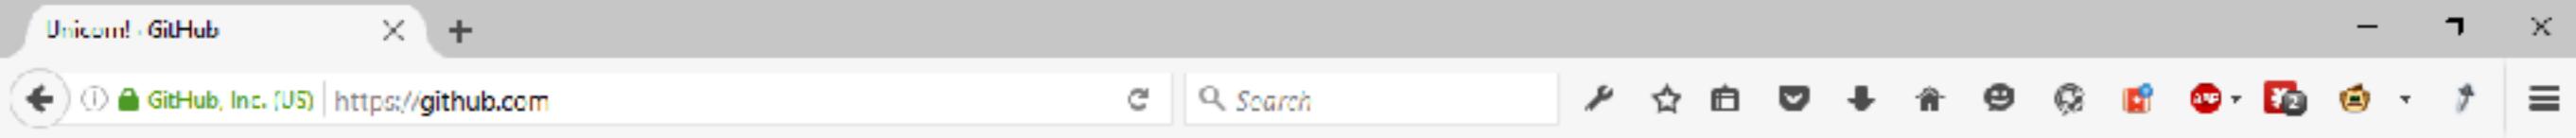

**CYBERSECURITY** IS THE TECHNIQUES OF  
PROTECTING COMPUTERS,  
NETWORKS,  
PROGRAMS AND  
DATA  
FROM **UNAUTHORISED ACCESS** OR **ATTACKS**  
THAT ARE AIMED FOR **EXPLOITATION**

OCT 2016.

A SERIES OF **DDOS ATTACKS** WERE LAUNCHED AGAINST **DNS SERVERS**, WHICH CAUSED MAJOR WEB SERVICES TO STOP WORKING

No server is currently available to service your request.

Sorry about that. Please try refreshing and contact us if the problem persists.

# The search engine for Power Plants

Shodan is the world's first search engine for Internet-connected devices.

[Create a Free Account](#)[Getting Started](#)

## Explore the Internet of Things

Use Shodan to discover which of your devices are connected to the Internet, where they are located and who is using them.

## Monitor Network Security

Keep track of all the computers on your network that are directly accessible from the Internet. Shodan lets you understand your digital footprint.

## See the Big Picture

Websites are just one part of the Internet. There are power plants, Smart TVs, refrigerators and much more that can be found with Shodan!

## Get a Competitive Advantage

Who is using your product? Where are they located? Use Shodan to perform empirical market intelligence.

Shodan is used around the world by researchers, security professionals, large enterprises, CERTs and everybody in between.

## Analyze the Internet in Seconds

Shodan has servers located around the world that crawl the Internet 24/7 to provide the latest Internet Intelligence. Who buys Smart TVs? Which countries are building the most wind farms? What companies are affected by Heartbleed? Shodan provides the tools to answer questions at the Internet-scale.

[Sample Report on Heartbleed](#)

## Ooops, your files have been encrypted!

English

▼

not so enough time.

You can decrypt some of your files for free. Try now by clicking <Decrypt>.

But if you want to decrypt all your files, you need to pay.

You only have 3 days to submit the payment. After that the price will be doubled.

Also, if you don't pay in 7 days, you won't be able to recover your files forever.

We will have free events for users who are so poor that they couldn't pay in 6 months.

### Payment will be raised on

1/4/1970 00:00:00

#### Time Left

00:00:00:00

### Your files will be lost on

1/8/1970 00:00:00

#### Time Left

00:00:00:00

[About bitcoin](#)

[How to buy bitcoins?](#)

[Contact Us](#)

### How Do I Pay?

Payment is accepted in Bitcoin only. For more information, click <About bitcoin>.

Please check the current price of Bitcoin and buy some bitcoins. For more information, click <How to buy bitcoins>.

And send the correct amount to the address specified in this window.

After your payment, click <Check Payment>. Best time to check: 9:00am - 11:00am GMT from Monday to Friday.

Once the payment is checked, you can start decrypting your files immediately.

### Contact

If you need our assistance, send a message by clicking <Contact Us>.

We strongly recommend you to not remove this software, and disable your anti-virus for a while, until you pay and the payment gets processed. If your anti-virus gets updated and removes this software automatically, it will not be able to recover your files even if you pay!

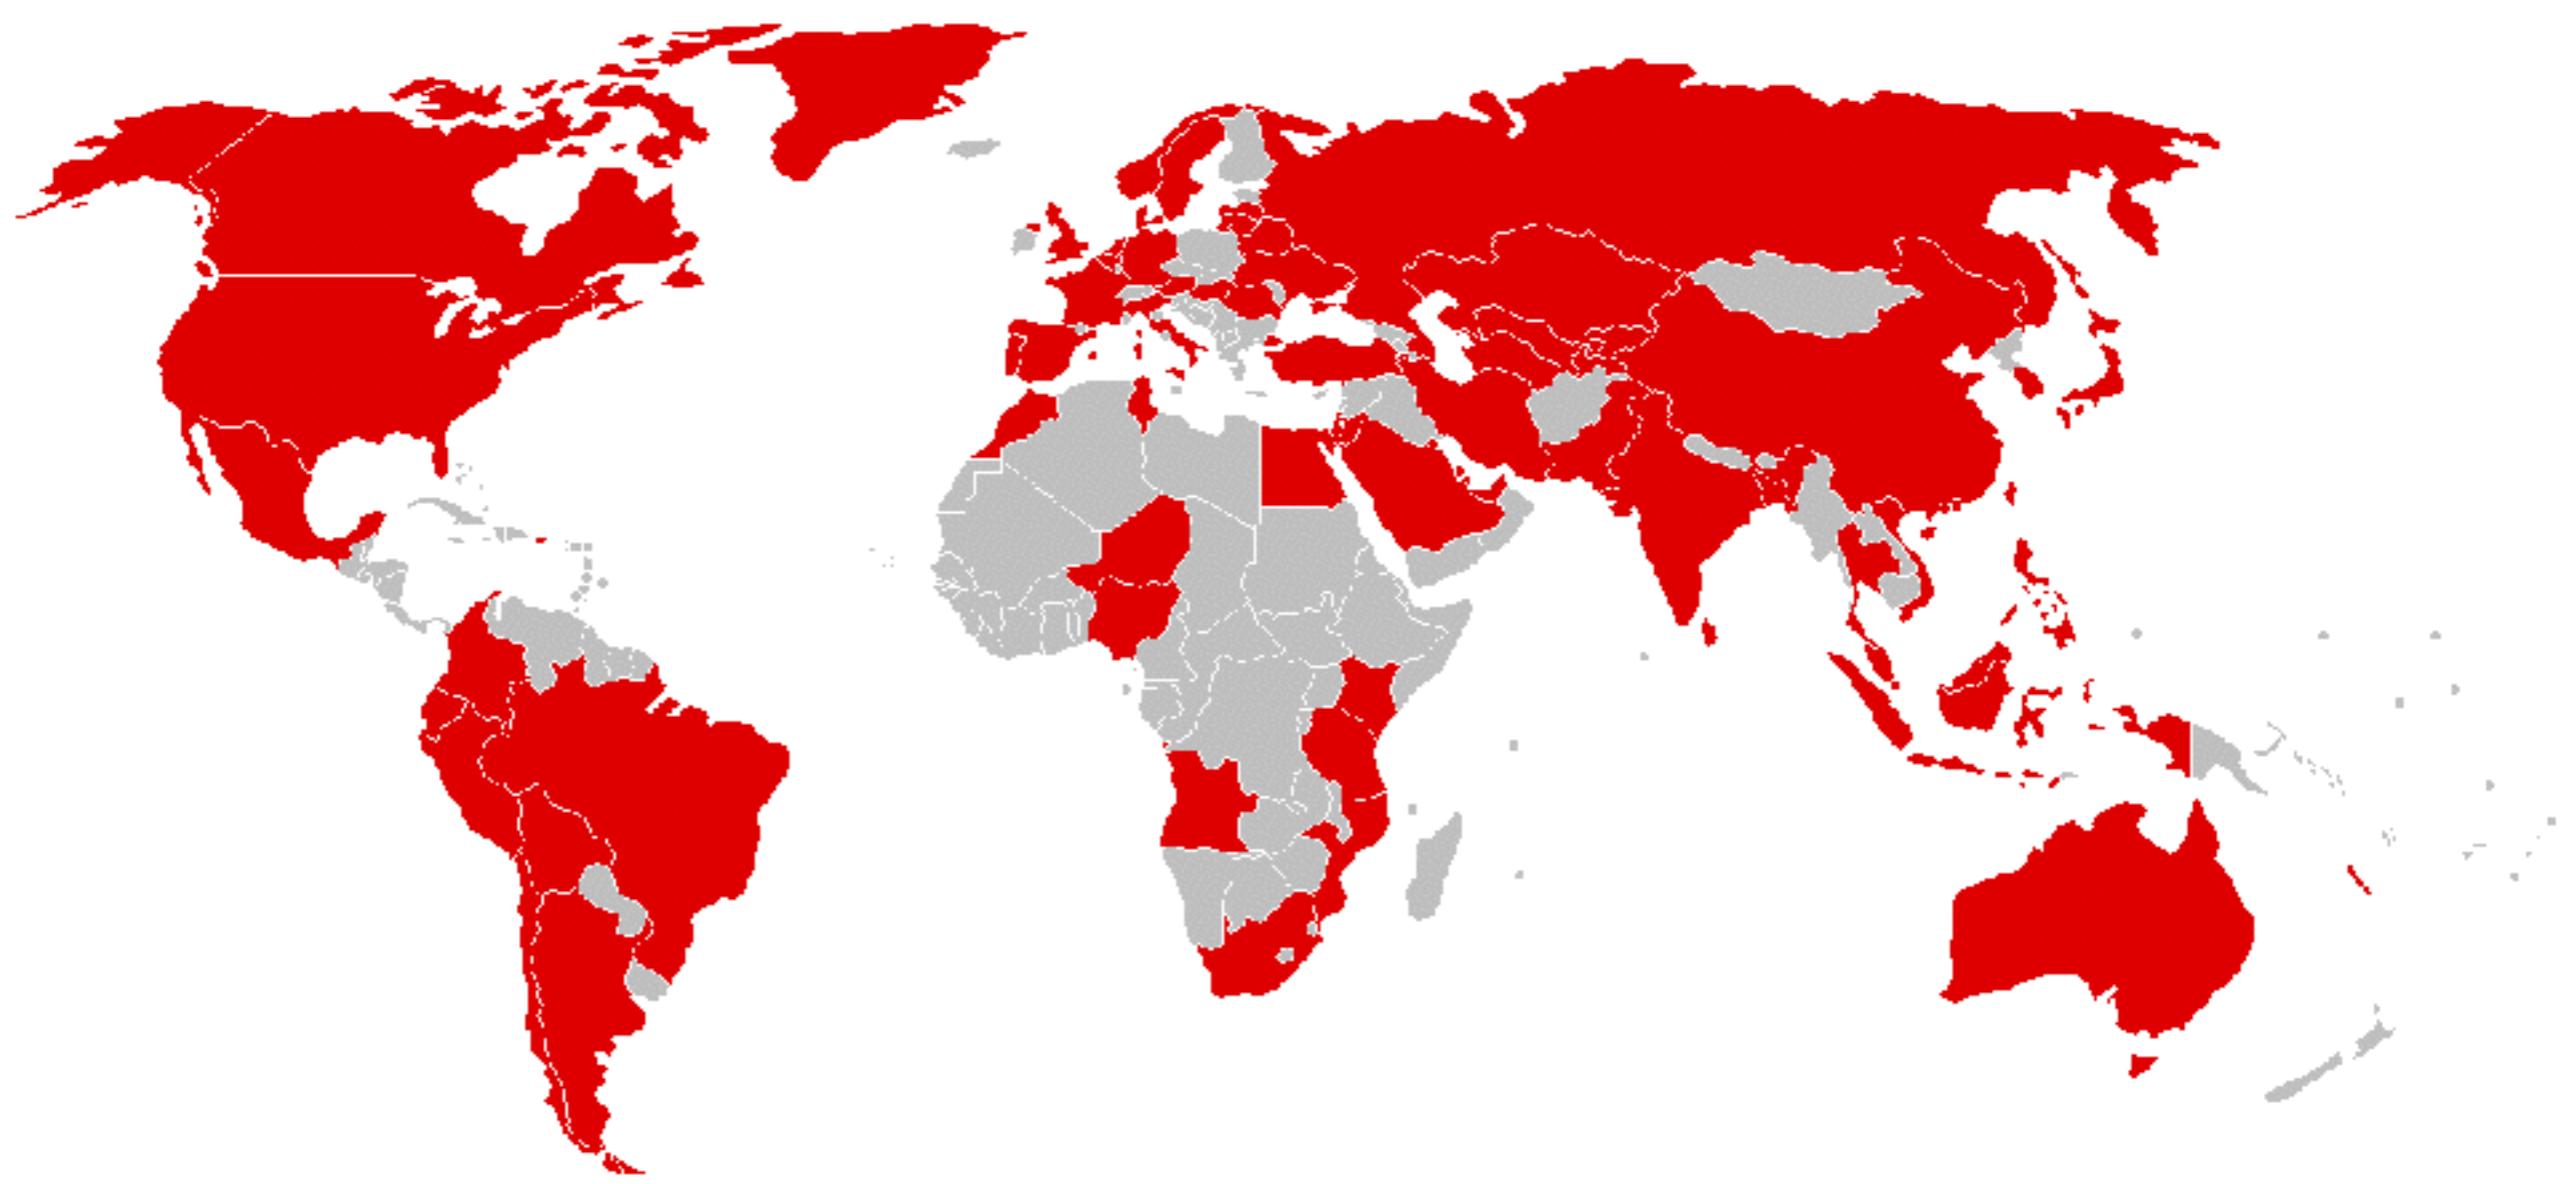

Send \$600 worth of bitcoin to this address:

Dirk Saunders <yxpnmjarrettlwq@outlook.com>

12:07 PM (8 minutes ago)

to me ▾

I know, ██████████, is your pass word. you may not know me and you are most likely thinking why you're getting this e-mail, correct?

Well, I installed a malware on the adult video clips (pornography) and you know what, you visited this web site to have fun (you know what I mean). When you were watching video clips, your browser started operating as a Rdp (Remote desktop) that has a key logger which gave me accessibility to your screen and also cam. Just after that, my software program gathered every one of your contacts from messenger, social networks, as well as email.

What exactly did I do?

I created a double-screen video. First part displays the video you were watching (you've got a good taste lol), and 2nd part displays the recording of your web cam.

Exactly what should you do?

Well, I believe, \$1200 is a fair price for our little secret. You'll make the payment through Bitcoin (if you don't know this, search "how to buy bitcoin" in google).

BTC ADDRESS: 1JC99fcQMVR4iHdmf3GbHLGHMkPpyFjBu7

(It's CASE sensitive, so copy and paste it carefully)

Note:

You have one day to make the payment. (I've a specific pixel in this message, and right now I know that you've read this e mail). If I do not receive the Bitcoins, I will certainly send out your video recording to all of your contacts including friends and family, colleagues, and so forth. nonetheless, if I receive the payment, I'll destroy the video immediately. If you need proof, reply with "yes!" and I definitely will send your video recording to your 14 friends. It is a non-negotiable one time offer, thus don't ruin my time & yours by responding to this e-mail.

WAS DONE BESIDES **BAD PR** FOR THE TRUMP CAMPAIGN

# WEB APP SECURITY

THE CRYPTOMINER INCIDENT

The screenshot shows the ICO (Information Commissioner's Office) website at <https://ico.org.uk>. The page features the ICO logo and tagline: "The UK's independent authority set up to uphold information rights in the public interest, promoting openness by public bodies and data privacy for individuals". Below the header is a navigation menu with links: Home, For the public, For organisations, Report a concern, Action we've taken, and About the ICO.

The main content area has two tabs: "Information rights and" and "Take action". The "Information rights and" tab is active. The "Take action" tab is visible below it.

At the bottom of the screen, the Chrome DevTools Network tab is open, showing network activity. The "Network" tab is selected. A specific request for the file "html.js" is highlighted in the list, showing its source code:

```
<!DOCTYPE html>
<!--[if lt IE 8 ]><html lang="en" class="ie8"><![endif]-->
<!--[if lt IE 9 ]><html lang="en" class="ie9"><![endif]-->
<!--[if (gt IE 9)|!(IE)]><!-->
<html lang="en" class="js">
  <!--<![endif]-->
  <head prefix="og: http://ogp.me/ns#">...</head>
...<body id="top" style class="ccc-left ccc-triangle ccc-light ccc-impl ccc-consented ccc-hidden"> == $0
```

The "Elements" tab is also visible in the DevTools interface.

## A better experience for every website visitor

Give all your website visitors a better experience – and reduce barriers between your content and all your audiences.

Our innovative support software adds speech, reading, and translation to websites facilitating access and participation for people with Dyslexia, Low Literacy, English as a Second Language, and those with mild visual impairments.

Online content can be read aloud in multiple languages using the most natural and engaging voice to transform the user's reading experience.

Try Browsealoud on your site instantly >

## Add the toolbar in three easy steps...

If you want to provide your web audience with the additional reading and translation support provided by Browsealoud, you need to embed our HTML code [into](#) your website.

```
<script type="text/javascript" src="//www.browsealoud.com/plus/scripts/ba.js"></script>

Less ⚡ More

December 7, 2011  
event-stream  
package created

October 16, 2015  
event-stream  
enters maintenance\*  
mode.

August 5, 2018  
Antonio Macias\*\* published  
non-malicious package  
flatmap-stream to npm.

September 9, 2018  
released  
event-stream@3.3.6,  
that uses flatmap-stream.

- November 20, 2018:  
FallingSnow opens the issue  
against event-stream
- November 26, 2018  
HackerNews post appears
- November 26, 2018  
flatmap-stream package  
removed from npm
- November 26, 2018  
Multiple users report the issue  
to Snyk which is added to Snyk  
Vuln DB on the same day.
- November 26, 2018  
Danny Grander from Snyk  
reported the issue to the Node.js  
Foundation Security WG
- October 5th, 2018  
An infected version of  
flatmap-stream@0.1.1 was  
released to the ecosystem. All  
new installs of event-stream  
will pick this version up.

\* Releases are less frequent. Only minor fixes being issued. \*\* This is the pen name which was given by the user on npm.

JULY, 2015. GITHUB USER, DEVIOUS, COMMENTS ON  
AN ISSUE ON THE EVENT-STREAM PROJECT  
QUESTIONING **WHETHER A FLATMAP  
FUNCTIONALITY WOULD BE WELCOMED**

# SOCIAL ENGINEERING DEVS

**devinus** commented on Jul 31, 2015

...

@dominictarr Interesting. Would you accept a `flatMap` patch using this functionality?

**devinus** commented on Jul 31, 2015

...

I wonder why `mapSync` uses `emit` rather than `queue`.

**dominictarr** commented on Jul 31, 2015

Owner

...

@**devinus** ah, it's probably just old. I don't use this module anymore, i now use  
<https://github.com/dominictarr/pull-stream>

If you publish a `flatMap` module and then make a pr to include it, i'll merge.

AUGUST, 2018. A USER IDENTIFIED AS 'ANTONIO MACIAS' IN NPM CREATED AND **PUBLISHED A NON-MALICIOUS PACKAGE** CALLED FLATMAP-STREAM

NEXT, ANTONIO PROPOSED THAT THE EVENT-STREAM PROJECT USES THE FLATMAP PACKAGE

**RIGHT9CTRL APPROACHED DOMINIC ASKING TO ASSIST WITH THE PROJECT AND TO MAKE THE NECESSARY CHANGES**

DOMINIC ACCEPTED RIGHT9CTRL'S OFFER AND MAKES THEM A CONTRIBUTOR TO THE EVENT-STREAM GITHUB PROJECT, AS WELL AS **GAVE RIGHT9CTRL FULL NPM PUBLISHING RIGHTS FOR THE MODULE** ON THE NPM ECOSYSTEM

**September 4, 2018:** an innocent dependency upgrade.

**September 4/5, 2018:** added map and split examples [0cc](#), [ee8](#), [c08](#), [05b](#)

**September 5, 2018:** released event-stream version 3.3.5 with [918](#).

**September 9, 2018:** the flatmap-stream dependency was added under [e31](#)

**September 9, 2018:** created a new minor event-stream release 3.3.6 in [599](#)

**September 16, 2018:** flatmap-stream was removed from the event-stream code in [908](#) and from the dependency tree in [2bd](#) and released as a major version, 4.0.0

**September 20, 2018:** [right9ctrl](#) adds further cosmetic code changes that enhance the project's keywords in [60d](#) to presumably further improve the search results on the official npmjs.com registry website

**October 5, 2018:** a new minor version flatmap-stream@0.1.1 was released with the injection attack in its minified source code. Installations of event-stream will now also fetch the new infected 0.1.1 version of flatmap as a transient dependency.

OCTOBER, 2018. JAYDENSERIC OPENED AN  
ISSUE AGAINST NODEMON REPORTING AN  
**UNEXPECTED DEPRECATION WARNING**

# Deprecation warning at start #1442

 Closed

jaydenseric opened this issue on Oct 29 · 10 comments

jaydenseric commented on Oct 29

+ ...

The latest version of Nodemon on the latest version of Node.js causes a deprecation warning to be logged when starting.

This relates to Nodemon and not my start script, because when I run `npm start` directly (not via Nodemon) no deprecation warning is logged.

- `nodemon -v` : 1.18.5
- `node -v` : 11.0.0
- Operating system/terminal environment: macOS
- Command you ran:

```
{  
  "watch": "nodemon",  
  "start": "node --experimental-modules --no-warnings -r dotenv/config server"  
}
```

# Backdoored sub-dependency? flatmap-stream-0.1.1 and flatmap-stream-0.1.2 #1451

 Closed

NewEraCracker opened this issue 10 days ago · 0 comments

NewEraCracker commented 10 days ago

+  ...

nodemon requires pstree.remy (^1.1.0 - installed 1.1.0) -> ps-tree (^1.1.0 - installed 1.1.0) -> event-stream (~3.3.0 - installed 3.3.6) -> flatmap-stream (^0.1.0 - npm installs 0.1.2).

This last one is very suspicious.

See: [dominictarr/event-stream#115](#)

Please either force version 0.1.0 of flatmap-stream or update event-stream to latest version (which no longer requires the affected module).

Regards.

THIS WAS A TARGETED ATTACK

## EventStream

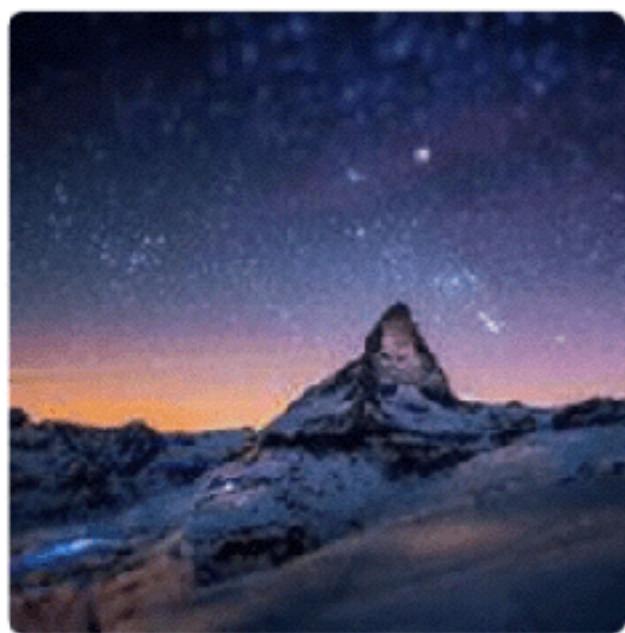

[Streams](#) are node's best and most misunderstood idea, and EventStream is a toolkit to make creating and working with streams easy.

Normally, streams are only used for IO, but in event stream we send all kinds of objects down the pipe. If your application's input and output are streams, shouldn't the throughput be a stream too?

The `EventStream` functions resemble the array functions, because Streams are like Arrays, but laid out in time, rather than in memory.

All the `event-stream` functions return instances of `Stream`.

`event-stream` creates `0.8 streams`, which are compatible with `0.10 streams`.

### ANNOUNCING GLOBAL APPSECs DC and AMSTERDAM 2019!

Every vibrant technology marketplace needs an unbiased source of information on best practices as well as an active body advocating open standards. In the Application Security space, one of those groups is the Open Web Application Security Project™ (or OWASP for short).

The Open Web Application Security Project (OWASP) is a 501(c)(3) worldwide not-for-profit charitable organization focused on improving the security of software. Our mission is to make software security [visible](#), so that [individuals and organizations](#) are able to make informed decisions. OWASP is in a unique position to provide impartial, practical information about AppSec to individuals, corporations, universities, government agencies, and other organizations worldwide. Operating as a community of like-minded professionals, OWASP issues software tools and knowledge-based documentation on application security.

Everyone is free to participate in OWASP and [all of our materials](#) are available under a free and open software license. You'll find everything [about OWASP](#) here on or linked from our wiki and current information on our [OWASP Blog](#). OWASP does not endorse or recommend commercial products or services, allowing our community to remain vendor neutral with the collective wisdom of the best minds in software security worldwide.

We ask that the community look out for [inappropriate](#) uses of the OWASP brand including use of our name, logos, project names, and other trademark issues.

There are thousands of [active wiki users](#) around the globe who review the changes to the site to help ensure quality. If you're new, you may want to check out our

# USING COMPONENTS WITH KNOWN VULNERABILITIES

The flowchart illustrates the progression of a security threat. It starts with 'Threat Agents' (represented by a stick figure icon) leading to 'Attack Vectors' (represented by a box with an arrow icon). This leads to 'Security Weakness' (represented by a box with an arrow icon). Finally, it leads to 'Impacts' (represented by a cylinder icon).

App. Specific	Exploitability: 2	Prevalence: 3	Detectability: 2	Technical: 2	Business ?
While it is easy to find already-written exploits for many known vulnerabilities, other vulnerabilities require concentrated effort to develop a custom exploit.		Prevalence of this issue is very widespread. Component-heavy development patterns can lead to development teams not even understanding which components they use in their application or API, much less keeping them up to date.  Some scanners such as <a href="#">retire.js</a> help in detection, but determining exploitability requires additional effort.		While some known vulnerabilities lead to only minor impacts, some of the largest breaches to date have relied on exploiting known vulnerabilities in components.  Depending on the assets you are protecting, perhaps this risk should be at the top of the list.	

# IS YOUR APPLICATION VULNERABLE?

- If you don't know **the versions of all components** you use (both client-side and server-side)
- If you don't **scan for vulnerabilities regularly** or subscribe to security bulletins related to the components you use
- If you don't **fix or upgrade** the underlying platform, frameworks, and dependencies in a risk-based, timely fashion

# HOW YOU CAN PREVENT IT?

- Remove unused dependencies, unnecessary features, components, files, and documentation
- Continuously inventory the version of both client-side and server-side components and their dependencies using tools
- Only obtain components from official sources over secure links
- Prefer signed packages to reduce the chance of including a modified, malicious component
- Monitor for libraries and components that are unmaintained or do not create security patches for older versions
- Continuously monitor sources like CVE for vulnerabilities in the components

TOTAL CVE Entries: 121700

CVE® is a [list](#) of entries—each containing an identification number, a description, and at least one public reference—for publicly known cybersecurity vulnerabilities.

CVE Entries are used in numerous cybersecurity [products and services](#) from around the world, including the U.S. National Vulnerability Database ([NVD](#)).

## CNA Participation Growing Worldwide

### CVE Numbering Authorities (CNAs)

Totals CNAs: [100](#) | Total Countries: [16](#)

[CNAs](#) include vendors and projects, vulnerability researchers, national and industry CERTs, and bug bounty programs.

CNAs are how the [CVE List](#) is built. Every [CVE Entry](#) added to the list is assigned by a CNA.

[How to Become a CNA >>](#)

### CVE Working Groups Overview

The CVE Program has a number of [Working Groups \(WGs\)](#), actively focused on improving processes, workflows, and other aspects of the program as CVE continues to grow and expand.

In this post, you will learn about CVE's six current WGs:

- Automation (AWG)
- Strategic Planning (SPWG)
- CNA Coordination (CNACWG)
- CVE Entry Quality (QWG)
- CVE Workflow (CWG)
- Outreach and Communications (OCWG)

React applications which rendered to HTML using the ReactDOMServer API were not escaping user-supplied attribute names at render-time. That lack of escaping could lead to a cross-site scripting vulnerability. This issue affected minor releases 16.0.x, 16.1.x, 16.2.x, 16.3.x, and 16.4.x. It was fixed in 16.0.1, 16.1.2, 16.2.1, 16.3.3, and 16.4.2.

[Review all vulnerable dependencies](#)

**Note:** GitHub's security features, such as security alerts, do not claim to catch all vulnerabilities. Though we are always trying to update our vulnerability database and alert you with our most up-to-date information, we will not be able to catch everything or alert you to known vulnerabilities within a guaranteed time frame. These features are not substitutes for human review of each dependency for potential vulnerabilities or any other issues, and we recommend consulting with a security service or conducting a thorough vulnerability review when necessary.

# Automated dependency updates

Dependabot creates pull requests to keep your dependencies secure and up-to-date.

[Sign up](#)

[Learn how it works](#)

1,193,192 pull requests merged, and counting!

## How it works

1

### Dependabot checks for updates

Dependabot pulls down your dependency files and looks for any outdated or insecure requirements.

2

### Dependabot opens pull requests

If any of your dependencies are out-of-date, Dependabot opens individual pull requests to update each one.

3

### You review and merge

You check that your tests pass, scan the included changelog and release notes, then hit merge with confidence.

[Report abuse](#)

Dependabot helps you keep your dependencies up to date. It works with most popular languages.

Every day, Dependabot checks your dependency files for outdated requirements and opens individual pull requests for any it finds. You review the PRs, merge them, and get to work on the latest, most secure releases.

Dependabot is owned and maintained by GitHub. Dependabot Preview is a public beta for functionality that we are integrating directly into GitHub.

### [Security] Bump bower from 1.8.2 to 1.8.8 #80

Merged dependabot[ci skip] commit into master from dependabot[ci skip] 7 days ago

The screenshot shows a GitHub pull request titled "[Security] Bump bower from 1.8.2 to 1.8.8 #80". The PR has been merged. The commit message is "Bumps bower from 1.8.2 to 1.8.8. This update includes security fixes." It mentions that vulnerabilities have been fixed and sources from The Node Security Working Group. The PR details include release notes, commits, and maintainer changes. Labels include "dependabot" and "security". The pull request has been merged. A note says "Dependabot will resolve any conflicts with this PR as long as you don't alter it yourself. You can also trigger a rebase manually by commenting @dependabot rebase". Another note says "If all status checks pass the dependabot will automatically merge this pull request." The pull request has 10 reviews and 10 approvals. It was created 7 days ago.

## Example `config.yml` files

### With only required options

```
version: 1
update_configs:
  # Keep package.json (& lockfiles) up to date as soon as
  # new versions are published to the npm registry
  - package_manager: "javascript"
    directory: "/"
    update_schedule: "live"
  # Keep Dockerfile up to date, batching pull requests weekly
  - package_manager: "docker"
    directory: "/"
    update_schedule: "weekly"
```

### With default labels and reviewers

```
version: 1
update_configs:
  # Update your Gemfile (& lockfiles) as soon as
  # new versions are published to the RubyGems registry
  - package_manager: "ruby:bundler"
    directory: "/"
    update_schedule: "live"

  # Apply default reviewer and label to created
  # pull requests
  default_reviewers:
    - "github-username"
  default_labels:
    - "label-name"
```

## Available configuration options

The config file must start with `version: 1` followed by an array of `update_configs`.

Option	Required	Description
<code>package_manager</code>	yes	What package manager to use
<code>directory</code>	yes	Where to look for package manifests
<code>update_schedule</code>	yes	How often to check for updates
<code>target_branch</code>	no	Branch to create pull requests against
<code>default_reviewers</code>	no	Reviewers to set on pull requests
<code>default_assignees</code>	no	Assignees to set on pull requests
<code>default_labels</code>	no	Labels to set on pull requests
<code>default_milestone</code>	no	Milestone to set on pull requests
<code>allowed_updates</code>	no	Limit which updates are allowed
<code>ignored_updates</code>	no	Ignore certain dependencies or versions
<code>automerged_updates</code>	no	Updates that should be merged automatically
<code>version_requirement_updates</code>	no	How to update manifest version requirements
<code>commit_message</code>	no	Commit message preferences

# Validate your .dependabot/config.yml file

```
1 # This is an example with only required properties:  
2 version: 1  
3 update_configs:  
4   - package_manager: "javascript"  
5     directory: "/"  
6     update_schedule: "live"  
7
```

Looks good

## Settings

**Update schedule**

Live updates

Dependabot will create pull requests as soon as new versions are published to the npm registry.

**Directory (optional)**

/

Relative to repository's root

**Target branch (optional)**

Branch to create pull requests against. If blank Dependabot will use your repo's default branch (master).

**Filters**

Only security updates  
 Only lockfile updates (ignore updates that require package.json changes)

**Update strategy for package.json**

How should Dependabot update your package.json (as opposed to your lockfile)?

Auto (bump versions if an app, widen ranges if a library)

**Automatic PR merging**

Dependabot can automatically merge dependency update PRs for you. For all of the options below we'll wait until all your status checks pass before merging. You can also set working hours for automerging in your account settings.

Runtime dependency PRs to merge automatically

None

Development dependency PRs to merge automatically

None

**Whitelisted dependencies to merge automatically (all versions)**

Search...

Only top-level dependencies can be whitelisted

Snyk is on a mission to help developers use open source and stay secure.  
Snyk helps find, fix (and prevent!) known vulnerabilities in your Node.js, Java, Ruby, Python and Scala apps. Snyk is free for open source.

Snyk tracks vulnerabilities in over 800,000 open source packages, and helps protect over 25,000 applications.

83% of Snyk users found vulnerabilities in their applications, and new vulnerabilities are disclosed regularly, putting your application at risk.

[Read more...](#)

The screenshot shows the Snyk dashboard interface. At the top, there's a search bar labeled "search projects" and a button "Add projects". Below the search bar, there are filters for "GitHub", "npm", "Ruby", and "Python". A "language" dropdown is set to "JavaScript" and a "sort" dropdown is set to "New". The main area displays a list of projects:

- candidae/pug**: package.json (5 vulnerabilities), Gemfile.lock (5 vulnerabilities). Last tested: 1 hour ago.
- flat-coated-retriever**: package.json (0 vulnerabilities).
- candidae/pyrenean-shepherd**: package.json (1 vulnerability), Gemfile.lock (0 vulnerabilities). Last tested: 1 day ago.
- candidae/anatolian-shepherd**: Gemfile.lock (2 vulnerabilities). Last tested: 1 week ago.
- candidae/saint-bernard**: (no files listed).

Below the projects, a section titled "Find: Quickly scan all your repos and get a high level overview on the amount of known vulnerabilities" shows five small screenshots of different dashboard sections.

## 🛡 Denial of Service (DoS)

Vulnerable module: [mem](#)

Introduced through: [gatsby@2.1.31](#)

### Detailed paths and remediation

- Introduced through: `pride-london-web@0.1.0 > gatsby@2.1.31 > @gatsbyjs/relay-compiler@2.0.0-primer-fix.2 > yargs@9.0.1 > os-locale@2.1.0 > mem@1.1.0`

Remediation: No remediation path available.

### Vulnerable functions

`index.module.exports.memoized()`

`index.module.exports.memoized.setData()`

### Overview

[mem](#) is an optimization used to speed up consecutive function calls by caching the result of calls with identical input.

Affected versions of this package are vulnerable to Denial of Service (DoS). Old results were deleted from the cache and could cause a memory leak.

snyk-bot APP 10:33 AM

Your Snyk alerts are set up! You'll get alerts for projects in the **Pride in London** organisation.

Snyk will notify you about new vulnerabilities that affect your projects, and when new upgrades and patches become available.

snyk-bot APP 3:37 PM

### Prototype Pollution

New vulnerability in package `lodash.merge` at the Pride in London organisation.

#### Severity

Low

#### Package

lodash.merge

#### Issue ID

[SNYK-JS-LODASHMERGE-173732](#)

#### Affected projects:

[PrideInLondon/pride-london-web:package.json](#)

**Package version:** 4.6.1

[Fix with the CLI wizard](#)

# FEATURES - CSP & SRI

**CONTENT SECURITY POLICY** (CSP) IS AN ADDED LAYER OF SECURITY THAT HELPS TO DETECT AND MITIGATE CERTAIN TYPES OF ATTACKS, INCLUDING **XSS** AND **DATA INJECTION ATTACKS**

THESE ATTACKS ARE USED FOR EVERYTHING FROM DATA THEFT TO SITE DEFACEMENT TO DISTRIBUTION OF MALWARE

Content-Security-Policy:  
`default-src https://www.example.com`

## Content Security Policy

**Content Security Policy (CSP)** is an added layer of security that helps to detect and mitigate certain types of attacks, including Cross Site Scripting (XSS) and data injection attacks. These attacks are used for everything from data theft to site defacement to distribution of malware.

#### References:

- ▶ [HTTP headers](#)

CSP is designed to be fully backward compatible (except CSP version 2 where there are some explicitly-mentioned inconsistencies in backward compatibility; more details [here](#) section 1.1). Browsers that don't support it still work with servers that implement it, and vice-versa: browsers that don't support CSP simply ignore it, functioning as usual, defaulting to the standard same-origin policy for web content. If the site doesn't offer the CSP header, browsers likewise use the standard [same-origin policy](#).

To enable CSP, you need to configure your web server to return the [Content-Security-Policy](#) HTTP header (sometimes you will see mentions of the [X-Content-Security-Policy](#) header, but that's an older version and you don't need to specify it anymore).

Alternatively, the [`<meta>`](#) element can be used to configure a policy, for example: `<meta http-equiv="Content-Security-Policy" content="default-src 'self'; img-src https://*; child-src 'none';">`

## Threats

### Mitigating cross site scripting

A primary goal of CSP is to mitigate and report XSS attacks. XSS attacks exploit the browser's trust of the content received from the server. Malicious scripts are executed by the victim's browser because the browser trusts the source of the content, even when it's not coming from where it seems to be coming from.

CSP makes it possible for server administrators to reduce or eliminate the vectors by which XSS can occur by specifying the domains that the browser should consider to be valid sources of executable scripts. A CSP compatible browser will then only execute scripts loaded in source files received from those allowlisted domains, ignoring all other script (including inline scripts).

# Content Security Policy Reference

The new **Content-Security-Policy** HTTP response header helps you reduce XSS risks on modern browsers by declaring, which dynamic resources are allowed to load.

<b>Content-Security-Policy</b> <small>CSP 1.0</small>	25+	23+	7+	-	Edge 12 build 10240+
<b>X-Content-Security-Policy</b> <small>Deprecated</small>	-	4+	-	10+ <i>Limited</i>	12+ <i>Limited</i>
<b>X-WebKit-CSP</b> <small>Deprecated</small>	14+	-	6+	-	-

Sources: [caniuse.com/contentsecuritypolicy](http://caniuse.com/contentsecuritypolicy), [caniuse.com/contentsecuritypolicy2](http://caniuse.com/contentsecuritypolicy2) & [Mozilla](https://developer.mozilla.org/en-US/docs/Web/HTTP/Headers/Content-Security-Policy)

Try our [CSP Browser Test](#) to test your browser.

Note: It is known that having both **Content-Security-Policy** and **X-Content-Security-Policy** or **X-WebKit-CSP** causes unexpected behaviours on certain versions of browsers. Please avoid using deprecated **X-\*** headers.

Directive	Example Value	Description
<code>default-src</code>	<code>'self' cdn.example.com</code>	The <code>default-src</code> is the default policy for loading content such as JavaScript, Images, CSS, Fonts, AJAX requests, Frames, HTML5 Media. See the <a href="#">Source List Reference</a> for possible values.
		<small>CSP Level 1</small>    
<code>script-src</code>	<code>'self' js.example.com</code>	Defines valid sources of JavaScript.
		<small>CSP Level 1</small>    
<code>style-src</code>	<code>'self' css.example.com</code>	Defines valid sources of stylesheets.
		<small>CSP Level 1</small>    
<code>img-src</code>	<code>'self' img.example.com</code>	Defines valid sources of images.
		<small>CSP Level 1</small>    
<code>connect-src</code>	<code>'self'</code>	Applies to <code>XMLHttpRequest</code> (AJAX), <code>WebSocket</code> or <code>EventSource</code> . If not allowed the browser emulates a <code>400</code> HTTP status code.
		<small>CSP Level 1</small>    
<code>font-src</code>	<code>font.example.com</code>	Defines valid sources of fonts.
		<small>CSP Level 1</small>    
<code>object-src</code>	<code>'self'</code>	Defines valid sources of plugins, eg <code>&lt;object&gt;</code> , <code>&lt;embed&gt;</code> or <code>&lt;applet&gt;</code> .
		<small>CSP Level 1</small>    
<code>media-src</code>	<code>media.example.com</code>	Defines valid sources of audio and video, eg HTML5 <code>&lt;audio&gt;</code> , <code>&lt;video&gt;</code> elements.
		<small>CSP Level 1</small>    
<code>frame-src</code>	<code>'self'</code>	Defines valid sources for loading frames. <code>child-src</code> is preferred over this deprecated directive.
		<small>Deprecated</small>
<code>sandbox</code>	<code>allow-forms allow-scripts</code>	Enables a sandbox for the requested resource similar to the <code>iframe sandbox</code> attribute. The sandbox applies a same origin policy, prevents popups, plugins and script execution is blocked. You can keep the sandbox value empty to keep all restrictions in place, or add values: <code>allow-forms</code> , <code>allow-same-origin</code> , <code>allow-scripts</code> , <code>allow-popups</code> , <code>allow-modals</code> , <code>allow-orientation-lock</code> , <code>allow-pointer-lock</code> , <code>allow-presentation</code> , <code>allow-popups-to-escape-sandbox</code> , and <code>allow-top-navigation</code>
		<small>CSP Level 1</small>    

Source Value	Example	Description
*	img-src *	Wildcard, allows any URL except data: blob: filesystem: schemes.
'none'	object-src 'none'	Prevents loading resources from any source.
'self'	script-src 'self'	Allows loading resources from the same origin (same scheme, host and port).
data:	img-src 'self' data:	Allows loading resources via the data scheme (eg Base64 encoded images).
domain.example.com	img-src domain.example.com	Allows loading resources from the specified domain name.
*.example.com	img-src *.example.com	Allows loading resources from any subdomain under example.com .
https://cdn.com	img-src https://cdn.com	Allows loading resources only over HTTPS matching the given domain.
https:	img-src https:	Allows loading resources only over HTTPS on any domain.
'unsafe-inline'	script-src 'unsafe-inline'	Allows use of inline source elements such as style attribute, onclick, or script tag bodies (depends on the context of the source it is applied to) and javascript: URIs
'unsafe-eval'	script-src 'unsafe-eval'	Allows unsafe dynamic code evaluation such as JavaScript eval()
'nonce-'	script-src 'nonce-2726c7f26c'	Allows script or style tag to execute if the nonce attribute value matches the header value. For example: <script nonce="2726c7f26c">alert("hello");</script>
'sha256-'	script-src 'sha256-qzn...ng='	Allow a specific script or style to execute if it matches the hash. Doesn't work for javascript: URIs. For example: sha256-qznLcsR0x4GACP2dm0UCKCzCG+Hiz1guq5ZZDob/Tng= will allow alert('Hello, world.');

# Content-Security-Policy Examples

Here a few common scenarios for content security policies:

## Allow everything but only from the same origin

```
default-src 'self';
```

## Only Allow Scripts from the same origin

```
script-src 'self';
```

## Allow Google Analytics, Google AJAX CDN and Same Origin

```
script-src 'self' www.google-analytics.com ajax.googleapis.com;
```

## Starter Policy

This policy allows images, scripts, AJAX, and CSS from the same origin, and does not allow any other resources to load (eg object, frame, media, etc). It is a good starting point for many sites.

```
default-src 'none'; script-src 'self'; connect-src 'self'; img-src 'self'; style-src 'self';
```

**Subresource Integrity (SRI)** is a security feature that enables browsers to verify that resources they fetch (for example, from a [CDN](#)) are delivered without unexpected manipulation. It works by allowing you to provide a cryptographic hash that a fetched resource must match.

**Note:** For subresource-integrity verification of a resource served from an origin other than the document in which it's embedded, browsers additionally check the resource using [Cross-Origin Resource Sharing \(CORS\)](#), to ensure the origin serving the resource allows it to be shared with the requesting origin.

## How Subresource Integrity helps [🔗](#)

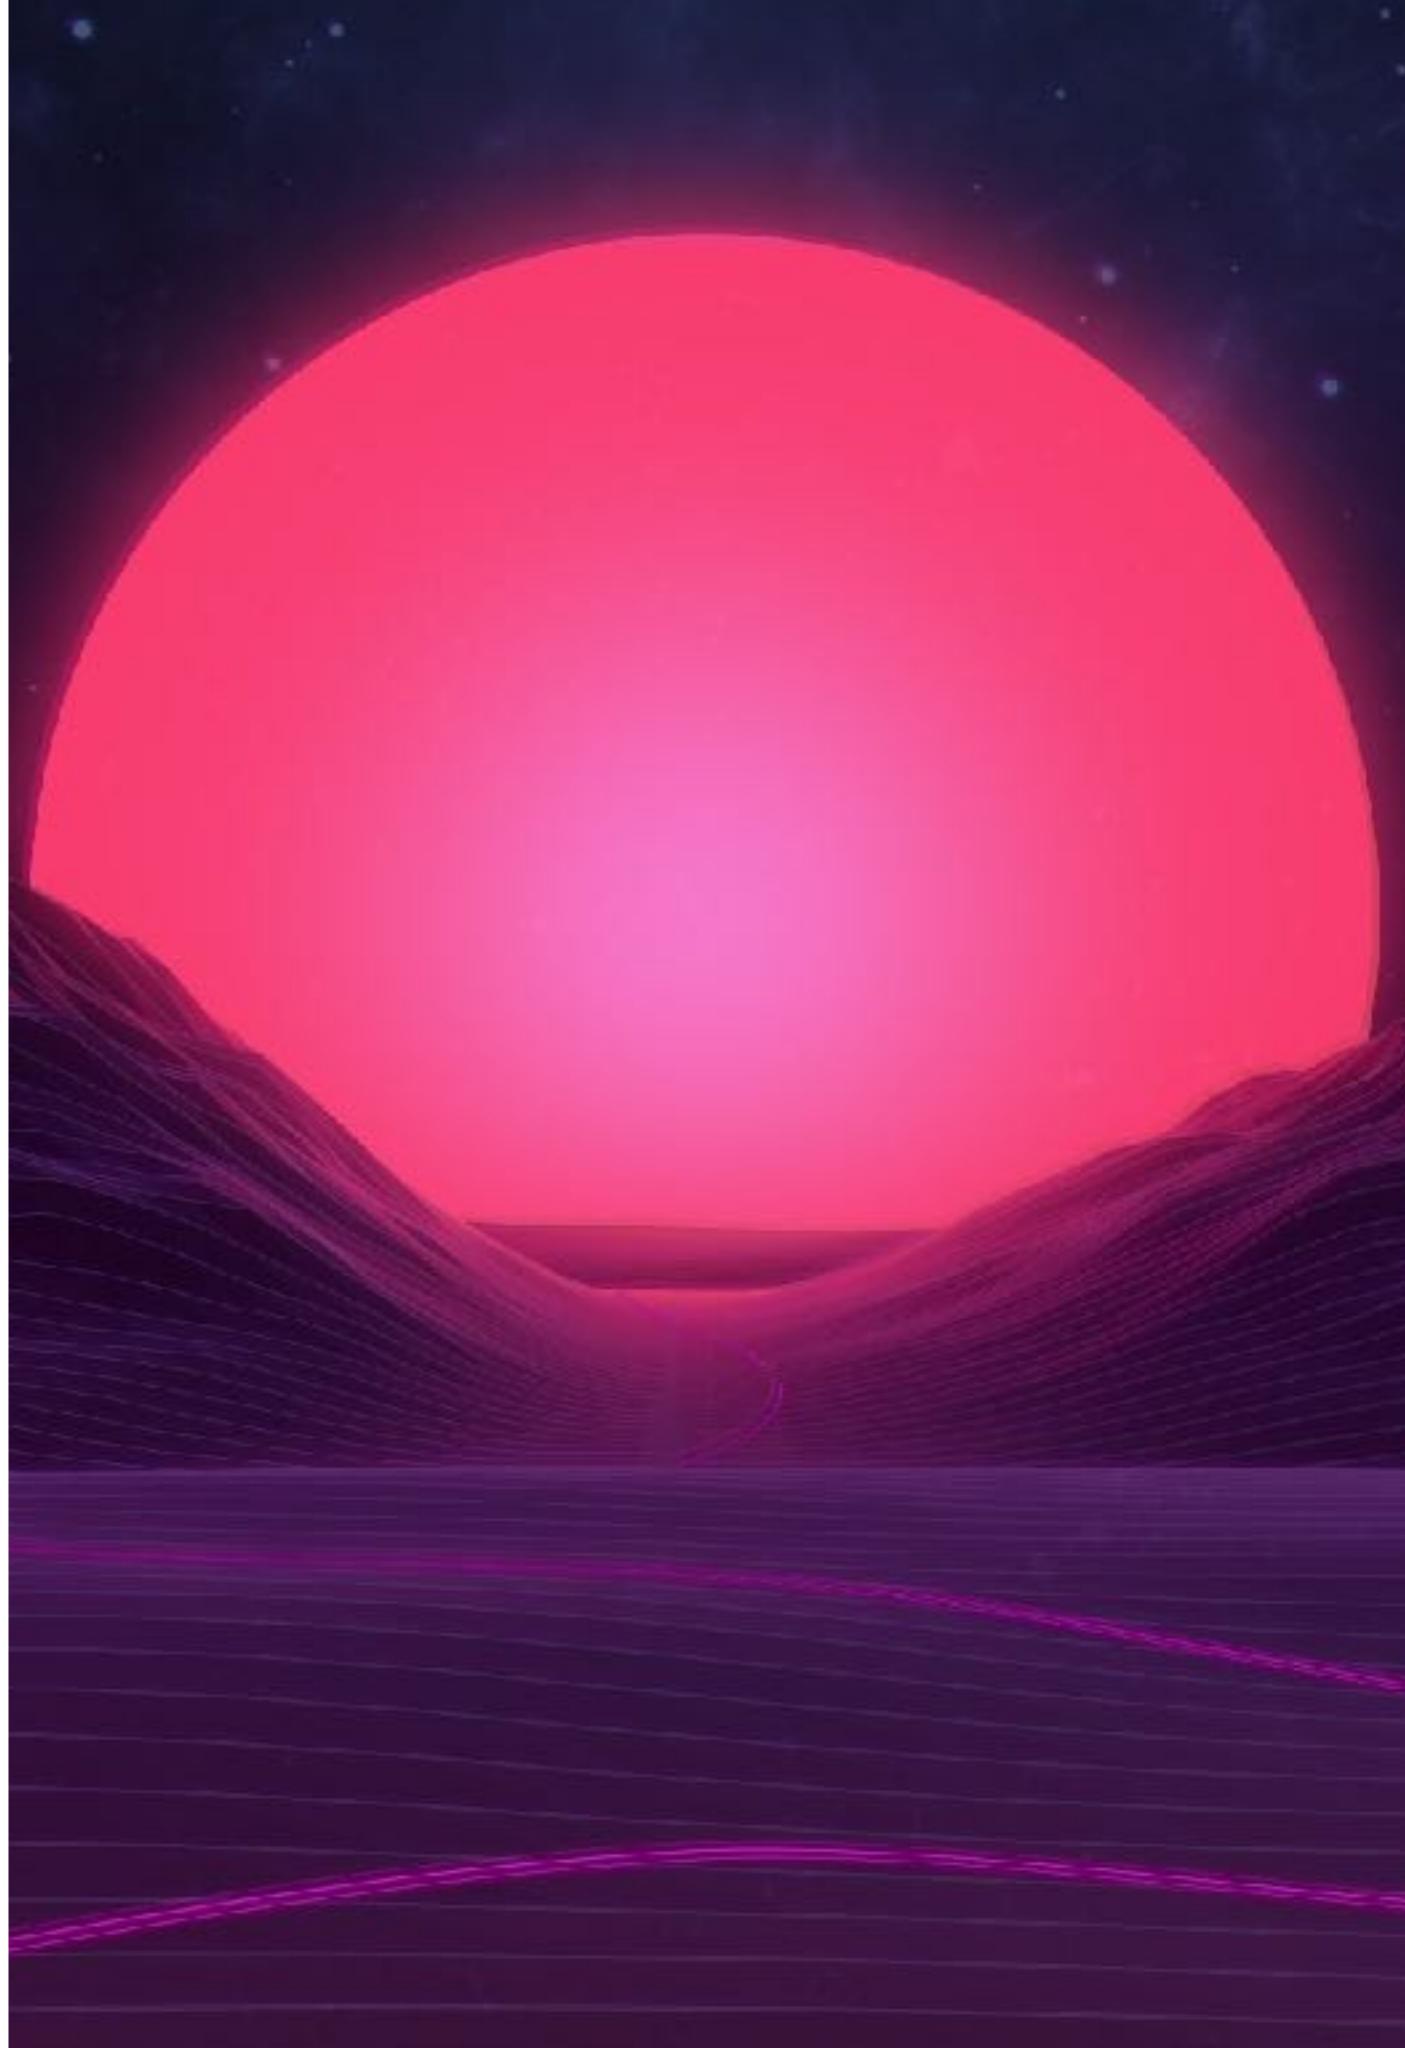

Using [Content Delivery Networks \(CDNs\)](#) to host files such as scripts and stylesheets that are shared among multiple sites can improve site performance and conserve bandwidth. However, using CDNs also comes with a risk, in that if an attacker gains control of a CDN, the attacker can inject arbitrary malicious content into files on the CDN (or replace the files completely) and thus can also potentially attack all sites that fetch files from that CDN.

Subresource Integrity enables you to mitigate some risks of attacks such as this, by ensuring that the files your web application or web document fetches (from a CDN or anywhere) have been delivered without a third-party having injected any additional content into those files — and without any other changes of any kind at all having been made to those files.

## Using Subresource Integrity [🔗](#)

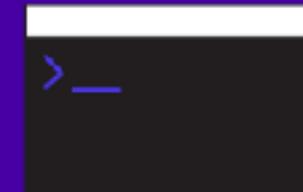

You use the Subresource Integrity feature by specifying a base64-encoded cryptographic hash of a resource (file) you're telling the browser to fetch, in the value of the `integrity` attribute of any `<script>` or `<link>` element.

sri warns about requesting scripts or stylesheets without using subresource integrity.

### Why is this important?

A common practice in modern web development is to use third party resources from CDNs or different services (analytics, ads, etc.). However, doing so can increase the attack surface of your web site/app.

While there are techniques to verify the agent is talking with the right server (TLS, HSTS, etc.), an attacker (or administrator) with access to the server can manipulate the content with impunity.

If you want to load a crypto miner on 1,000+ websites you don't attack 1,000+ websites, you attack the 1 website that they all load content from. ([Scott Helme](#))

Subresource integrity is a standard that mitigates this by ensuring that an exact representation of a resource, and only that representation, loads and executes.

### What does the hint check?

This hint checks that a website correctly uses SRI, more specifically:

- All the downloaded resources by an `<script>` or `<link rel="stylesheet">` have an `integrity` attribute.
- The `integrity` attribute needs to be valid. I.e.: it should contain something in the form of `sha(256|384|512)-HASH`, where `HASH` is the hashed value of the downloaded body's response using the previously specified algorithm (`sha256`, `sha384`, or `sha512`).
- The minimum cryptographic hash function used is `sha384`. If multiple ones are provided, the highest one will be used to determine if the baseline is met.
- When using a cross-origin resource (e.g.: using a script hosted in a third party CDN), the `<script>` or `<link>` tag needs to have a valid `crossorigin` attribute.
- The resource is served on a `secure context` (i.e.: HTTPS) to guarantee the HTML and resource haven't been tampered during the delivery.
- The hash from the `integrity` attribute needs to be the same as the one calculated using the response's body.
- If multiple hashes are provided, at least one needs to be valid.

### Examples that trigger the hint

Cross-origin resource with no `crossorigin` attribute:

[Overview](#)[Scoring Guides](#)[Lighthouse v3 Migration Guide](#)[Audit References](#)[Performance](#)[Progressive Web App](#)[Accessibility](#)[Best Practices](#)[SEO](#)

# Lighthouse

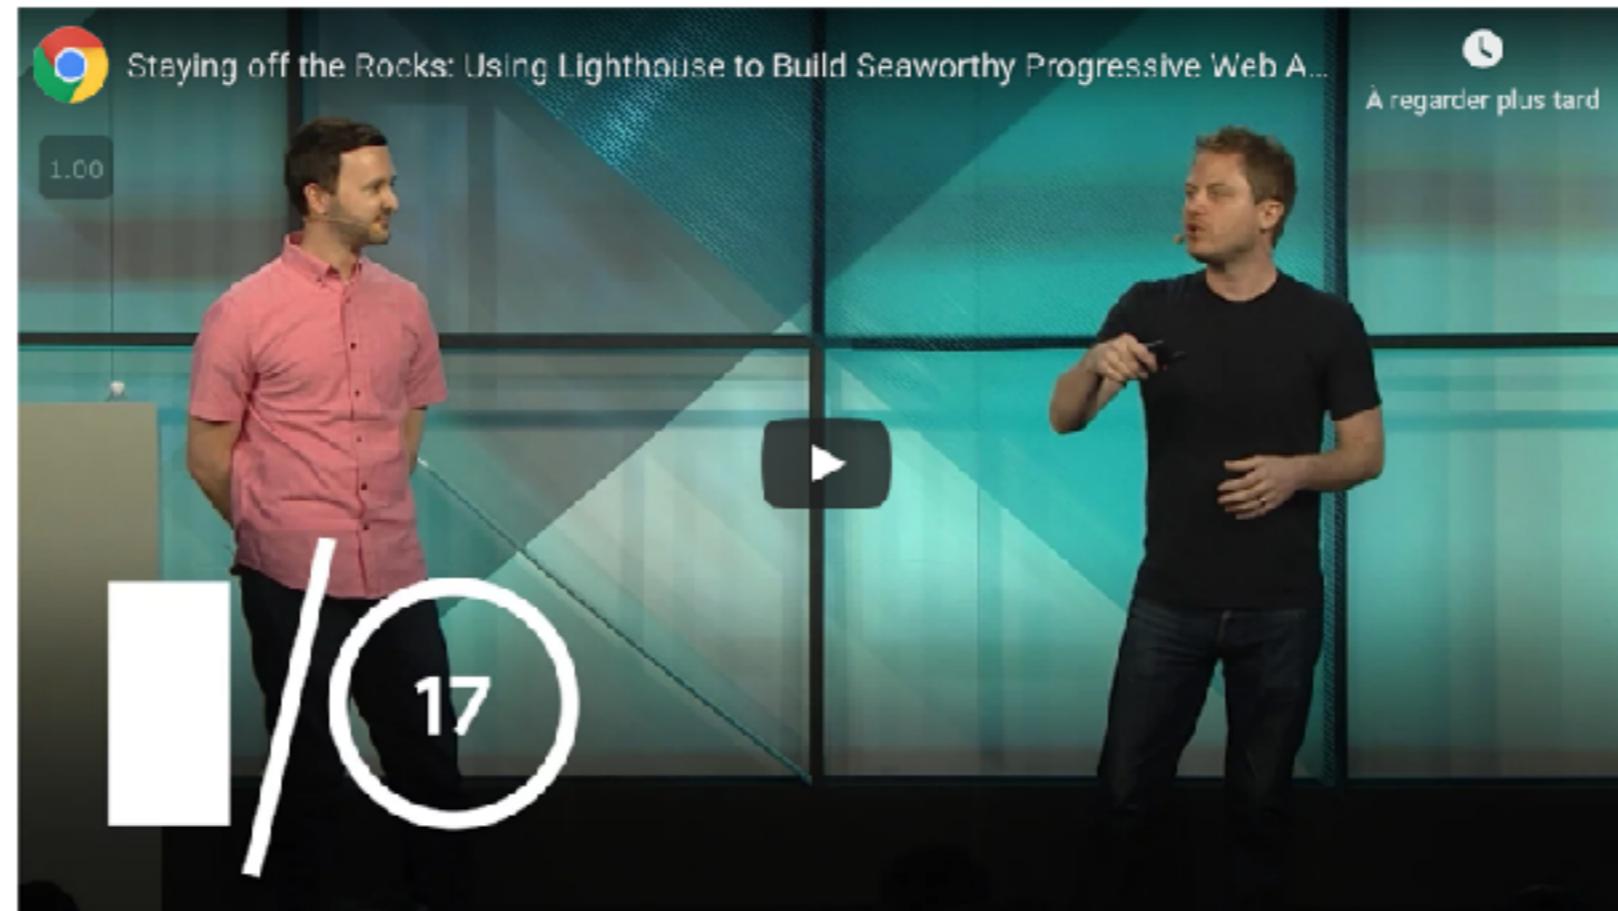

Lighthouse is an [open-source](#), automated tool for improving the quality of web pages. You can run it against any web page, public or requiring authentication. It has audits for performance, accessibility, progressive web apps, and more.

You can run Lighthouse in Chrome DevTools, from the command line, or as a Node module. You give Lighthouse a URL to audit, it runs a series of audits against the page, and then it generates a report on how well the page did. From there, use the failing audits as indicators on how to improve the page. Each audit has a reference doc explaining why the audit is important, as well as how to fix it.

[RUN LIGHTHOUSE IN CHROME DEVTOOLS](#)[FILE AN ISSUE](#)

Check out the video below from Google I/O 2017 to learn more about how to use and contribute to Lighthouse.

WHAT'S NEXT -  
**SECURITY  
CHAMPIONS**

# Security Champions playbook

## Identify teams

- Enumerate products and services
- List teams per each product
- Identify Product manager (responsible for product) and team manager (working directly with developers)
- Write down technologies (programming languages) used by each team

## Define the role

- Measure current security state among the teams and define security goals you plan to achieve in mid-term (e.g. by using OWASP SAMM)
- Identify the places where champions could help (such as verifying security reviews, raising issues for risks in existing code, conducting automated scans etc.)
- Write down clearly defined roles, as these will be the primary tasks for newly nominated champions to work on

## Nominate champions

- Introduce the idea and role descriptions and get approvals on all levels - both from product and engineering managers, as well as from top management
- Together with team leader identify potentially interested candidates
- Officially nominate them as part of your security meta-team

## Comm channels

- Make sure to have an easy way to spread information and get feedback
- While differing from company to company, this usually includes chats (Slack/IRC channel, Yammer group, ...) and separate mailing lists
- Set up periodic sync ups - bi-weekly should be fine to start with

## Knowledge base

- Build a solid internal security knowledge base, which would become the main source of inspiration for the champions
- It should include security meta-team page with defined roles, secure development best practices, descriptions of risks and vulnerabilities and any other relevant info
- Pay special attention to clear and easy-to-follow checklists, as it's usually the simplest way to get the things going

## Maintain interest

- Develop your ways or choose one of the below to keep in touch and maintain the interest of the champions
- Conduct periodic workshops and encourage participation in security conferences
- Share recent appsec news (e.g. Ezine) via communication channels
- Send internal monthly security newsletters with updates, plans and recognitions for the good work
- Create champions corner with security library, conference calendar, and other interesting materials
